### INDUSTRY DIVISION

Owen C. Gretton, Chief

## Acknowledgments

The 1967 Census of Manufactures was conducted under the direction of Owen C. Gretton, Chief, and Milton Eisen, Assistant Chief. Elmer S. Biles, assisted by John S. Berube, Clifford Bennett, and Kenneth I. Hansen, was responsible for the overall management of the census and was the Industry Division's liaison officer with other Divisions.

Program responsibility along industry lines was shared by the following individuals who participated importantly in the entire census program: Robert J. Nealon, Foods, Textiles, and Apparel; Cyril M. Wildes, Chemicals and Wood Products; and Paul F. Berard, Metals and Metal Products. Willis K. Jordon was responsible for preparation of the introductory text and appendix materials. Edward A. Robinson made significant contributions to the basic concepts and content of the census. Donald F. Clark and Carl J. Bostrom, under the direction of Jack L. Ogus, developed the mathematical techniques utilized in editing the data and in sampling the respondents. Louis J. Owen, assisted by William R. Gray was responsible for the inquiries relating to fuel, electric energy, and water data. William Cooper had staff responsibility for industry classification and the system of classifying products and materials. Wayne M. McCaughey and Angela R. Daly also participated importantly in various phases of the project.

Professional personnel in the commodity areas of the Industry Division developed the report forms for the various industries, reviewed the tabulations, and prepared the industry texts that accompanied the data. The respective areas and the individuals in charge during the census were as follows: Foods, Charles H. W. Sedgewick and Carole A. Klein; Textiles, Evelyn O. Denny; Apparel, Bennie A. Daniels; Wood Products, Kenneth E. McBeth; Pulp and Paper, Lonnie M. Conner; Chemicals, Reese R. Morgan; Metals, Malcolm E. Bernhardt; Machinery, John P. McNamee; and Electrical Machinery and Transportation, Dale W. Gordon. The names of the supporting statisticians in the commodity areas who made significant contributions are shown in the acknowledgment statements appearing in the 80 industry reports published separately prior to their assembly into the Industry Volume.

Systems and procedures were developed in the Systems Division, Sol Dolleck, Chief, by Eugene Wendt assisted by Samuel Schweid. Clerical procedures were developed by Alvin Barten, Evelyn V. Williams, Carmen Taylor, Geraldine Manuel, Carl Mueller, Thomas Lowenstein, and Jack Margolis. Electronic computer programs for check-in, geographic coding, and administrative records were developed and supervised by Charles Venters and Terence McDowell under the direction of Zigmund Decker and Andrew Grieco. James Moyers, Gene Haggy, Paul Poissant, and Stephan Potemkin developed and supervised the electronic computer editing and tabulation programs under the direction of Mary H. Johnson. Quality control plans and procedures were developed and supervised by Maxwell D. Jeane, assisted by John Powell and Carl Jablin. Data input procedures were developed and supervised by Leonard Tauber assisted by Paul Blackmer. Production controls were established under the supervision of Francis Boucher and James R. Pepal.

Processing of reports was performed in the Jeffersonville Census Operations Division, Joseph F. Arbena, Chief, by James S. Werking assisted by Margaret Rommel and Jordan Horne. Clerical processing was supervised by Charles Adams and quality control plans and procedures were implemented and monitored under the direction of Kathern Clay.

Data processing and related operations were performed by the Processing Division, M. Douglas Fahey, Chief, assisted by R. M. Micol, James Shores, and E. R. Bourdon.

Report planning and editorial review were provided by Geraldine Censky and Frances Bresnahan of the Administrative and Publications Services Division.

Arthur Horowitz, in his capacity as the coordinator of the economic censuses, made important contributions to the planning and operational phases of the work. Robert Parker contributed in the analysis of reports for the large and complex corporate organizations. James Corbett developed the computer systems for disclosure analysis, assisted by Robert Reynolds.

Special acknowledgment is due to the many businesses whose cooperation has contributed to the publication of the data.

## Preface

This is one of a series of volumes presenting the final results of the 1967 Census of Manufactures, which was part of the economic censuses covering that year. In addition to the manufacturing sector, the 1967 economic censuses included wholesale and retail trade, certain services, transportation, construction, commercial fishing, and mining. The censuses measured the activities of nearly 4,000,000 business establishments, including 300,000 engaged in manufacturing.

As in previous census years, the advice and counsel of trade and professional associations, individual companies, Federal and State agencies, labor unions, and research and educational organizations were most valuable in planning the content of the census reports. The Advisory Council on Federal Reports, comprised of representative businessmen, provided special assistance in determining the feasibility of collecting the various types of data. Other advisory committees which counsel the Census Bureau regularly contributed significantly in the planning and preparatory stages. Timely publicity was given by chambers of commerce, newspapers, trade periodicals, and television and radio stations.

As essential element in the Census of Manufactures was the excellent cooperation of the many thousands of manufacturing companies which completed the necessary census questionnaires.

## I. GENERAL BACKGROUND

### 1. THE ECONOMIC CENSUSES

**General.**—The economic censuses provide a comprehensive statistical profile of a large segment of the national economy. In 1967, these censuses accounted for nearly 70 percent of the \$555 billion of national income originating in the private sector. The principal industry groups not covered were finance, insurance, and real estate; agriculture and forestry; communications; and electric, gas, and sanitary services.

**Uses and Users of Census Data.**—The economic censuses are the primary source of facts about the structure and functioning of the economy and therefore provide information essential both for government and business. They furnish an important part of the framework for such composite measures as the national accounts. The census measures also provide weights and serve as benchmarks for current surveys of industrial activity and for indexes of industrial production, productivity, and price, all of which are essential in developing the general background for understanding particular economic situations.

There is widespread use of the economic censuses by manufacturers and distributors who need to establish measures of their potential markets in terms of areas, kinds of business, and kinds of products; and by management in various industries and trades which need facts for purposes of economic or sales forecasting, for analysis of sales performance, for the layout of sales territories, for the allocation of advertising budgets, and for the location of plants, warehouses, and stores. For these business purposes, census facts are invaluable. Likewise, trade and professional associations need census information to learn how their industry is changing; chambers of commerce need to know how their community is changing. State and local governments need to understand the business structure and changes occurring in their areas. Business magazines rely on census facts as background for many of their articles.

Following every census, reports are purchased by thousands of business and other users; likewise, census facts are widely disseminated by trade associations, business journals, and the daily press; census volumes are available in all the major public and college libraries.

**History.**—The first statistical survey which can be called an economic census covered the year 1809, when inquiries on manufacturing were included with the 1810 census of population. Although the results of this pioneer effort were unsatisfactory by modern standards,<sup>1</sup> continued interest in measurement of the Nation's economic progress led to successive improvements during the 19th century. By 1890, the statistical standards and procedures followed in conducting the censuses were of a fully professional quality.

All of the decennial censuses from 1810 through 1940, with the exception of 1830, included questions on manufacturing. Inquiries on mining first appeared in 1840, and censuses of mineral industries were conducted decennially through 1940. Although some business-related data were collected in 1840, the first census of business was taken for the year 1929. This included retail trade, wholesale trade, and construction; selected service trades were covered beginning with 1933. Dates of these and other economic censuses from 1809 are shown in table A.

**Enterprise Statistics.**—The coordinated collection and tabulation of comparable data for several sectors beginning with 1954 has permitted the Census Bureau to develop its enterprise statistics program, which relates census company-level data to the establishment data. Thus, a measurement of the integration and diversification of the American enterprise system becomes available. Also, through the enterprise statistics program, it has become possible to link census establishment-based data on a modified basis to other statistical systems such as the Internal Revenue Service's "Statistics of Income" for corporations.

**Legal Provisions.**—Title 13 of the United States Code specifies the frequency of the censuses, the kinds of activities to be covered, the obligation to report, the penalties for failure to report, and the confidentiality of returns. It also authorizes the use of sampling techniques in conducting censuses. As amended

in 1964, Title 13 requires the economic censuses to be taken at 5-year intervals, covering the years ending in "2" and "7." The next censuses will cover the year 1972. The pertinent portions of Title 13 are quoted in appendix E.

## 2. CHARACTERISTICS OF THE INDUSTRIAL SECTOR

**General.**—In terms of the major industry divisions established in the national accounts, manufacturing is the largest sector of the economy. In 1967, manufacturing plants employed 19 million persons, 26 percent of the civilian labor force of 74 million. Over the past 20 years, as shown in table B, national income originating in manufacturing has averaged 30 percent of the total. The next largest sector, wholesale and retail trade, declined from 19 percent in 1947 to 15 percent in 1967.

**Cyclical Changes.**—The need for frequent and comprehensive statistics on manufacturing derives as much from its sensitivity to

cyclical influences as from its relative size. Cyclical changes in income originating in manufacturing tend to be relatively larger than in the economy as a whole.

Within manufacturing, durable goods industries accounted for about 58 percent of all manufactures during recent periods. This category tends to be more volatile than nondurable goods, generally accounting for a smaller percentage of all manufactures during periods of contraction and a larger percentage during periods of expansion. In the early thirties, for example, as shown in table C, durable goods manufacturing amounted to only about one-third of the total.

**Geographic Distribution.**—In the 19th century, manufacturing activity was concentrated in the Northeast. Over the past hundred and twenty years, as shown in table D, there has been a steady decline in the proportion accounted for by the Northeastern States, and a marked growth in the South and West.

TABLE B. National Income by Industry Division for Selected Years

Industry	1929	1939	1947	1954	1958	1963	1967

**Size Distribution.**—While there are many small manufacturing plants, they account for a relatively small part of the total output of goods. As shown in table E, over half of the plants covered in the 1967 census had less than 10 employees but they accounted for less than 3 percent of the total value added by manufacture.

### 3. ROLE OF THE CENSUS OF MANUFACTURES

In the farm-oriented economy of the 19th century, industrial statistics played a relatively small role in government policy formation. A few series on physical output of commodities originated either from private sources (flour, iron, and steel, etc.) or as a byproduct of tax collection or other government functions (liquors, beer, tobacco products, etc.). Other than these, the only sources of information on the manufacturing sector were the censuses of manufactures, then taken at 10-year intervals. Today, the need for industrial statistics has greatly increased, and the user finds a vast array of detailed information covering virtually every measurable aspect of industrial activity including employment, payrolls, hours worked, production, prices, inventories, orders, investment in structures, machinery, and equipment, and consumption of raw materials,

fuels, and water. Many of these statistics are available at frequent intervals and on a timely basis. Sophisticated indicators of economic progress have also been developed such as price and production indexes, gross national product, and national income, published at monthly or quarterly intervals.

In this setting, the census of manufactures still plays an essential role since no other source provides such comprehensive and detailed information on the structure of the industrial sector. In effect, the census obtains, for every manufacturing plant with one employee or more, data on its input of labor, materials, and capital, its output of products and services, its location, and the legal form of organization of the owning firm.<sup>2</sup> These facts are obtained in sufficient detail to permit classification by industry, by size of plant, by homogeneity of output and, where desirable, by type of operation, extent of vertical integration, kind of equipment, relationship to other plants of the same firm, and other characteristics.

<sup>2</sup> For 1967, some of this information for 120,000 small companies was not obtained directly but estimated from administrative records. See the discussion of coverage of establishments in sections 4 and 6 below.

TABLE C. Total National Income and Amounts Originating in Durable and Nondurable Manufactures for Selected Years

(Dollar values in billions)

Year	National income	National income originating in manufacturing			Manufacturing as a percent of national income	Durable goods industries as a percent of total manufacturing
		Total	Nondurable goods industries	Durable goods industries		
1967.....	653.6	195.2	75.5	119.7	30	61
1966.....	620.6	191.5	72.9	118.5	31	62

Source: Survey of Current Business, August 1965, pp. 42-45; July 1966, p. 15; July 1968, p. 23; and August 1970, p. 21.

General statistics (that is, total employment, payroll, production-worker employment, man-hours, wages, cost of materials, value of shipments, inventories, capital expenditures, and value added by manufacture) from the census of manufactures are published by industry, by area, by employment size of establishment, by degree of product specialization within plant, and by type of ownership. Information is supplied on the detailed industrial characteristics of each State and large standard metropolitan statistical area (SMSA); and overall measures of manufacturing activity are shown at the county and individual city level down to cities of 10,000 or more population. The compilation entitled "Location of Manufacturing Plants" shows, for each of the 3,100 counties in the United States, the number of manufacturing plants, by size, for each of 420 industries. Information such as this constitutes a periodic inventory of the Nation's manufacturing economy that provides a benchmark for measuring the changes in its structure.

The census of manufactures also provides benchmarks from which more frequent surveys can be developed on a sample basis. In fact, the present legislation specifying that censuses be conducted every 5 years authorizes an Annual Survey of Manufactures (ASM) on a sample basis during the intervening years. After each 5-year census, a new sample is drawn utilizing the characteristics recorded for each company in the census. The sample, constituting about one-fifth of the establishments but with complete coverage of all large ones, provides an annual

updating of the census of manufactures in terms of broad measures of economic activity. It provides the same basic measures of economic activity of the plant such as employment, payrolls, value of shipments, value added by manufacture, as does the census of manufactures, but contains less detailed information on products, materials consumption, and equipment.<sup>3</sup>

The census of manufactures not only is a benchmark for many of the surveys conducted by the Census Bureau itself on a more frequent basis but also is the means of updating other indicators of economic activity. It provides very important information on the manufacturing segment used in the national income accounts. Census data on materials consumed and product output are basic to the manufactures sector of the input-output studies of the Office of Business Economics. The information derived from the census of manufactures is also used to develop indexes of industrial production for census years. These indexes are used as benchmarks for the monthly Federal Reserve Board Index of Industrial Production—a key indicator of

<sup>3</sup>Since the ASM is based on a sample, the cross-classifications by industry and by area are fewer than in the census of manufactures. At the U.S. level, statistics are published in the annual survey for practically all of the 420 industries. However, at the State and SMSA levels, statistics are published only for 3-digit and 2-digit industry groupings, respectively. At the county level, information is published for about 10 percent of the 3,100 counties. These 300-odd counties are the larger ones in terms of manufacturing activity and account for about 80 percent of total manufacturing employment. No information is published at the city level.

TABLE D. Employment in Manufacturing Establishments,  
by Region: 1849 to 1967

Year	United States	Northeast	North Central	South	West
Number of employees (thousands)

current economic activity. The census and ASM also provide benchmarks for hundreds of monthly and quarterly surveys of commodity output conducted by the Census Bureau, other government agencies, and by manufacturers' associations.

#### 4. INDUSTRY AND PRODUCT CLASSIFICATION

Structure of the Standard Industrial Classification.—The basic classification system employed in the economic censuses is the Standard Industrial Classification (SIC). The SIC was developed for use in the classification of establishments by type of activity in which engaged. It covers the entire field of economic activities, subdivided as follows:

Industrial division	Title	Major groups
A	Agriculture, forestry, and fisheries	01-09
B	Mining	10-14
C	Contract construction	15-17
D	Manufacturing	19-39
E	Transportation, communication, electric, gas, and sanitary services	40-49
F	Wholesale and retail trade	50-59
G	Finance, insurance, and real estate	60-67
H	Services	70-89
I	Government	91-94
J	Nonclassifiable establishments	99

Below the major group level, the SIC provides for 3-digit groups and finally for 4-digit industries. To illustrate—

##### Division D.—Manufacturing

Major Group 20 .....	Food and kindred products
Industry group 202 .....	Dairy products
Industry 2023 .....	Condensed and evaporated milk

The SIC is the responsibility of an intragovernmental technical committee headed by the Office of Management and Budget (formerly Bureau of the Budget). The system is used by all Federal Government agencies engaged in the classification of establishments. To facilitate comparison with Federal statistics and the filing of reports, many state and local governments and business concerns organize their own records along SIC lines.

The first SIC manual was issued in 1939. For the manufacturing sector, the nucleus of the manual was the census of manufactures industry classifications developed over a period of many years.<sup>4</sup>

Structure of the SIC Manufacturing Division.—For the manufacturing division, the 21 2-digit SIC Major Groups (19 to 39) are subdivided into 149 3-digit SIC Groups (191 to 399) and into 422 4-digit industries (1911 to 3999). While the SIC contains 422 industries, the Bureau of the Census has combined two small industries with others for a total of 420 industries.

Most of the 422 manufacturing industries are defined in terms of a specific group of related products. Usually, the products are made of similar materials and by similar processes, and are competitive. In determining the boundaries of product-

<sup>4</sup>For the manufacturing industries, a revised manual was issued in 1945 which, with minor modifications, was used in the 1947 census of manufactures. For the 1954 census, the classification structure used in 1947 was again employed, again with minor modifications. In 1957, the SIC system was extensively revised for manufacturing industries and historical comparability of some data was seriously affected. This revision and its effects on census series are described in the introduction and appendixes to the 1958 census volumes. Minor revisions of the SIC between 1958 and 1967 introduced some 4-digit industry changes but none of them crossed 3-digit group lines. Another extensive revision of the SIC, now under way, is scheduled to be effective with 1972.

defined industries,<sup>5</sup> it is essential that each industry comprise a group of establishments whose output of products defining the industry (primary products) accounts for a relatively high proportion of the total shipments of the industry as well as of the total shipments of these primary products by establishments in all manufacturing industries. Some industries are defined in terms of the processes or equipment used regardless of the final product of the establishment. A small number of industries are basically defined by material used as well as final product of the plant.

There are wide differences among industries in the extent to which the establishments classified in the industry (a) account for the total production of commodities "primary" to the industry, (b) produce products or services "belonging" to other industries (that is, secondary products), and (c) use similar materials or processes. While these variations are frequently construed to be shortcomings, the fact is that the limitations observed in the classification structure arise from the inherent complexity of our economic system and from the disparity in the methods of production among the individual producing units of which it is comprised. The data collected in the census of manufactures provide a statistical basis for a critical evaluation of the classification system; that is, for assessing the boundaries between industries, the growth and decline of industries, and the impact of technological change on the classification of industries.<sup>6</sup>

No general-purpose system of industrial classification can hope to satisfy all users of census data. Some business users will be interested primarily in data relating only to themselves and to their competitors in the production of a narrow range of products; others will wish data relating to all products, including complementary and substitutable products, competing in a particular market; others may wish data relating to the consumers of one or more types of materials. Some may be interested only in the data for plants producing a specific product; others only for those plants producing a "full line" of products. The large number of SIC industries provides the analyst with the "building blocks" for obtaining useful approximations, if not "clean" data, relevant to many of these problems. But, at best, a single general-purpose system of classification can only partially satisfy these diverse needs; a point is soon reached beyond which the adaptation of a system to serve one use somewhat better will reduce its ability, often disproportionately, to serve an alternative use.

Accordingly, users of data frequently regroup detailed SIC industries into broad groupings along lines different from those in the SIC 2- and 3-digit categories. The Federal Reserve Board for many years has made combinations to stress such criteria as durable, nondurable, consumers, producers, finished, intermediate goods, etc. Other public and private agencies also recombine the detailed classes. By and large, the 4-digit industries are susceptible to allocation to such categories, while the 2-digit SIC groups are not.

**Subindustries.**—To increase the usefulness or improve the editing of the data, the Census Bureau frequently has further classified the basic 4-digit SIC industries into "subindustries." This device is employed where there are wide disparities in the operating

ratios of the plants in the industry because of differences among plants in the degree of vertical integration, technology, methods of distribution, geographic location, types of materials used, etc. This technique was used for about 65 manufacturing industries for editing purposes and many were regarded as significant enough to be used for publication: For example, the bakery industry (SIC 2051) is subdivided into wholesale bakeries, chain-store bakeries, home-service bakeries, and retail multi-outlet bakeries and many apparel industries (Group 23) are subclassified into manufacturers, contractors, and jobbers.

To provide a further measurement of variations within 4-digit industries, the Bureau also subclassifies establishments by the degree to which they produce the primary products or specific classes of primary products of the 4-digit industry. This is in effect a subindustry classification based on degree of product specialization which is published in table 8 of the industry chapters.

**Definition of Manufacturing.**—As defined in the SIC, manufacturing is the mechanical or chemical transformation of inorganic or organic substances into new products. The assembly of component parts of products is also considered to be manufacturing if the resulting product is neither a structure nor other fixed improvement. These activities are usually carried on in plants, factories, or mills, which characteristically use power-driven machines and materials-handling equipment.

Manufacturing production is usually carried on for the wholesale market, for transfer to other plants of the same company, or to the order of industrial users rather than for direct sale to the household consumer. However, some manufacturers (for example, baking, milk bottling, etc.) sell chiefly at retail to household consumers through the mail, through house-to-house routes, or through salesmen. Some activities of a service nature (enameling, binding, platemaking, etc.) are included in manufacturing when they are performed primarily for trade; but they are considered nonmanufacturing when they are performed primarily to the order of the household consumer. On the other hand, some manufacturing industries include business firms which perform only the entrepreneurial functions of buying the materials and designing and marketing the product, but have the actual production done on contract (for example, apparel jobbers).

**Auxiliary Units.**—In addition to the production of goods and manufacturing services, manufacturing plants engage in related and diverse supporting activities. These activities encompass the acquisition of materials to be processed, their movement into the manufacturing facility, their storage at the manufacturing site, the operation and maintenance of plant and equipment, the design of flow of work through the production process, and necessary arrangements for shipment of output to customers. Also included are a host of subsidiary activities associated with the operation of the establishment as a manufacturing entity (for example, management and policy formation, product and market orientation, engineering and quality control, recordkeeping and accounting, physical security of plant and equipment, and the like). Such subsidiary activities may be performed by personnel located at the manufacturing facility or at an auxiliary unit serving one or more manufacturing locations of the same company. Where these activities are carried on at a different physical location or are performed for more than one plant, they are excluded from the figures for operating manufacturing establishments and are included in the data shown for central administrative offices and auxiliaries. (See the description of the questionnaire used for these establishments, Form NC-X6, in section 7, below.)

<sup>5</sup>Frequently, business analysts and other data users look at a group of products from more than one point of view. For example, modern high-speed computers are classified as office machines. This describes the purpose of the product. In a physical sense, however, such computers would be described as electronic devices. Similarly, paper bags, wooden boxes, glass bottles, tin cans, and steel barrels may all be classified as containers or they may be individually grouped with other products of similar materials such as converted paper products, wood products, glass products, etc.

<sup>6</sup>See *Industry Classification and Sector Measures of Industrial Production* by James W. McKie, Bureau of the Census Working Paper No. 20, 1965, and *Historical Comparability of Census of Manufactures Industries, 1929-1958* by Harold T. Goldstein, Bureau of the Census Working Paper No. 9, 1959.

**Marginal Activities.**—The following types of activities, while having some of the characteristics usually found in manufacturing, are considered as nonmanufacturing and, therefore, are excluded from the census:

(a) Processing on farms when the raw materials are grown on the farm and the manufacturing activities (poultry dressing, milk and butter production, logging) are on a small scale without extensive use of paid labor. Also custom milling, cotton ginning, egg hatching, and similar activities closely associated with agriculture are excluded.

(b) Mineral preparation such as the crushing, screening, and concentrating of ores. However, mining performed as a secondary activity in conjunction with manufacturing is included in the census unless a separate report for the mining activity was filed; for example, stone and clay mining at cement, lime, and clay products plants.

(c) Custom work to the individual order of household consumers. Examples are custom tailoring, woodworking, lettering on monuments, setting of diamonds, and the making of orthopedic appliances.

(d) Repair and other service activities, except specified services performed "for the trade." Repair shops of railroads are also excluded.

(e) Production of coke for own use by establishments owned by public utility companies.

In the 1967 census, no attempt was made to measure the extent of manufacturing at locations which are not primarily manufacturing plants, such as retail establishments which sell most of their products on the premises directly to household consumers (retail bakeries,<sup>7</sup> ice cream stores, etc.), or manufacturing by construction contractors at the site (for example, production of paving mixtures).

Conversely, it is not unusual for manufacturing establishments to engage also in nonmanufacturing activities such as repair work, merchandising of products without further processing, and installation work. Ordinarily, these nonmanufacturing receipts are small in relation to the manufacturing activities and, therefore, it is not difficult to determine that the establishments should be included in the manufactures area. However, if the nonmanufacturing activities account for a significant proportion of total receipts of an establishment, the classification of that establishment into the appropriate major economic sector is more difficult.

In the 1967 economic censuses, an establishment engaged in a combination of manufacturing and merchandising was assigned either to the manufacturing or the trade industries depending on which of these activities was estimated to account for the larger share of its "value added" or "income produced." This criterion, even though based on approximation, was considered preferable to reported dollar volume of receipts from each type of activity in determining the primary industry, since manufacturing requires considerably more man-hours, salaries and wages, and capital inputs per dollar of receipts than either wholesaling or retailing. However, in classifying establishments engaged in manufacturing and also in mining, repair work, installation, construction, or other nonmanufacturing services, dollar receipts were used as the basis of classification because these activities require substantially comparable input per dollar of receipts.

<sup>7</sup>Separate data for retail bakeries with baking on the premises were included in the retail census publications, however.

**Establishment Basis of Reporting.**—The SIC is an establishment classification system, and the census of manufactures is conducted on an establishment basis. That is, a company operating establishments at more than one location is required to submit a report for each location; also, a company engaged in distinctly different lines of activity at one location is required to submit separate reports if the plant records permit such a separation and if the activities are substantial in size.

The requirement that distinct lines of activity at the same location be separately reported was selectively applied where the establishment produced and shipped significant amounts of products classified in different SIC industries. In widely varying degrees, this product overlap exists in many manufacturing establishments. Generally, the amounts involved are not significant enough to warrant the filing of separate reports, even if feasible. However, there are a number of locations at which large numbers of employees are engaged in each of two or more distinct lines of manufacturing as defined in the SIC. Frequently, companies organize their operations and their records separately where diverse activities are large (for example, with more than 100 employees in each line of activity) and choose to report them as separate plants. When they do not do so on their own initiative, the Census Bureau requests separate reports. For the most part, companies have responded favorably, particularly for very large operations where failure to "split out" the different activities would significantly distort the relationship of the industry and product statistics. Not infrequently, though, the two groups of products were made on the same production lines by many of the same employees and could not be distinguished sufficiently in company records to provide establishment-type reporting.

SIC industry definitions take account of special situations where otherwise separately classifiable activities are frequently combined at one location. For example, in the lumber area the definition of industry 2421, Sawmills and Planing Mills, General, recognizes the situation that sawmills may include logging operations. Similarly, in the pulp and paper area, pulpmills operated in combination with papermills are included in one report.

**Coverage of Establishments.**—The censuses of manufactures for 1947 to date have included establishments with one employee or more. In the 1967 census, for the first time, reports were not obtained directly from all such establishments. Approximately 120,000 small manufacturing firms<sup>8</sup> were excused from filing reports; under special arrangements which safeguarded the confidentiality of both tax and census records, limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration (SSA) and the Internal Revenue Service (IRS) were made available to the Census Bureau for use in the 1967 economic censuses. Estimates for data other than payrolls and sales for these small establishments were constructed from historical industry ratios. The effect on industry aggregates is slight in most industries; for manufacturing as a whole, they account for only 1.2 percent of the value added. Detailed product and materials data for these small establishments were not estimated; the entire value of product shipments and cost of materials was imputed to a "not specified by kind" category.

In the censuses of 1921 through 1939, establishments with less than \$5,000 value of products were excluded. For 1899 to 1919, the limit was \$500. The change in the minimum size limit to an employment basis in 1947 did not appreciably affect the overall comparability of earlier census figures, except for the number of establishments.<sup>9</sup>

<sup>8</sup>The characteristics of these firms are discussed below in section 15.

<sup>9</sup>This point is discussed at greater length in the Introduction to the 1947 volumes.

A sample survey of manufacturing plants with no paid employees was conducted in conjunction with the 1958 census. While there were nearly 52,000 establishments in this category in that year, they accounted for only about one-quarter of 1 percent of the total value of shipments of all manufacturing industries. The proportion was higher for certain industry groups such as lumber and wood products and printing and publishing.

As indicated above, report forms were not mailed to 120,000 very small establishments. These establishments were assigned the industry classifications to which they had been coded in the 1963 Census of Manufactures, or if they had begun in business after 1963, on the basis of brief descriptions of the general activity of the establishment as reported to the Social Security Administration. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the total establishment count should be viewed as an approximation rather than a precise measurement. The counts for establishments with 20 or more employees are far more reliable than the total number of establishments.

**Primary and Secondary Products.**—As applied in the economic censuses, the SIC coding system operates in such a way that the definitions become progressively narrower with successive additions of numerical digits. At one extreme are the 21 very broad 2-digit groups and at the other about 10,500 individual 7-digit products. In between are approximately 150 3-digit groups, 420 4-digit industries, and 1,200 5-digit product classes. The 7-digit products and 5-digit product classes are considered the primary products of the industry with the same first four digits as the product code. Accordingly, an establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. The industry code assigned to the establishment is derived from a summation of values for 7-digit product codes to their 4-digit industry and the selection of the largest such value as the establishment's industry classification. However as mentioned earlier, the industry classification of an establishment may be determined not only by the products it makes but also by the processes employed or materials used in making those products.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. Therefore, the general statistics (employment, payrolls, inventories, value added by manufacture, total value of shipments, capital expenditures, etc.) shown for an industry (tables 1 to 4 of the industry chapters in Volume II) reflect not only the primary activities of the establishments in that industry but also their activities of a secondary nature. The product statistics in table 6 of the industry chapters represent the total output of specific products whether they are produced by establishments classified in the same industry as the product or not. For this reason, in relating the industry statistics in the industry chapters, especially the industry total value of shipments (tables 1 to 4), to the product statistics (table 6), the composition of the industry's output as shown in tables 5A and 5B should be considered.

The extent to which industry and product statistics may be matched with each other is measured by the two ratios which are computed from tables 5A and 5B. The first of the ratios, called the primary product specialization ratio, describes the proportion of product shipments (both primary and secondary) of the industry represented by primary products. The second, defined as the coverage ratio, is the proportion of primary products

shipped by the establishments classified in the industry to total shipments of such products by all manufacturing establishments.

**Degrees of Integration.**—In many industries, establishments making products falling into the same industry category use a wide variety of processes and materials to produce them. Also, within the same industry classification based on end products, may be included those establishments which are vertically integrated and those which put only the finishing touches on an already highly fabricated purchased item. For example, in the refrigeration industry, there are instances of almost complete process integration in which the production of the compressor and condensing unit, electric motor, and even the castings for those intermediate products, as well as the stamping of the case and the final assembly, are all carried on at one plant. In other plants, the condensing unit, the motor, and the case may be purchased and merely assembled into the finished product.

In some instances, nonintegrated plants have been placed in separate industry categories from the integrated plants. In many industries, the census provides separate statistics on departmental operations or on the production of intermediate commodities made and used in the producing plant. When an industry includes plants which ship a significant proportion of their output to other plants of the same company, separate figures are usually shown on the interplant transfers.

These differences in the integration of production processes, types of operations, and types of materials used should be taken into account when relating the general items (employment, payrolls, value added, etc.) to the product and materials data. For those industries where the integrated type of operations is of consequence, that fact is pointed out in the explanatory text for the industry.

**Industry Code Resistance.**—The production of many establishments is so evenly divided among two or more industry-determining product groups that the predominant groups (which can represent less than half of the total value if there are three or more groups) changes from year to year. In the ASM, these plants are prevented from shifting back and forth among industries due to minor shifts in product mix, by the application of a "resistance formula" in assigning industry classifications.

A resistance formula of the ASM type was first used in the 1963 Census of Manufactures and again applied in the 1967 census. In the 1967 census, the formula was applied only to establishments included in the 1966 ASM sample panel with certainty (that is, included with a probability of "1"). In general, certainty cases included all establishments of companies with at least one manufacturing plant with 100 employees or more (250 employees or more in the apparel manufacturing and printing and publishing industries). The formula gives approximately equal weight to the need for maintaining continuity in the establishment composition of an industry, thus improving the measurement of change, and the need for reflecting the industry's exact status at a point in time.

In the 1967 census, the industry classification of a certainty case was allowed to change from that assigned in 1966 under one of the following conditions:

- (1) The value of the 1967 primary products constituted 60 percent or more of its total value of product shipments, or

- (2) The value of the 1967 primary products, while less than 60 percent, was at least twice the value of the 1966 primary products in 1967, or

(3) The value of 1967 primary products, while not meeting either of the two prior conditions, exceeded the value of the 1966 primary industry's products in both 1967 and 1966 by at least 20 percent.

**The Classification of Products and Materials.**—In census industrial statistics, a commodity classification system based on the SIC is employed. The code numbers used in this system relate the commodity to the industry in which it is produced. For example, the 7-digit product code number 2023212 refers to canned evaporated milk. The first five digits of this code number, 20232, refer to the "product class" canned milk, and the first four digits, 2023, refer to the industry in which these products are made (the condensed and evaporated milk industry). The system is also applied to the coding of materials insofar as the first four digits are concerned; for example, the code number 013205 refers to whole milk used as a materials, and the first four digits of this code number, 0132, refer to the agricultural industry, dairy farms, where this product originates.

This SIC-based system is simpler than other systems for the coding of industrial products and materials used, since there is a

direct numerical relationship between commodities and industries. Complications occur in the few SIC industries defined in terms of processes or equipment used as well as products made. As an example, women's sweaters are produced in knitting mills (industry 2253) and also in cut-and-sew shops (industry 2339). To retain the industry-of-origin concept, therefore, it is necessary to assign different product code numbers to women's sweaters, depending on where they are made.

The SIC-based commodity classification is used in the Census Bureau's entire industrial statistics program, including monthly, quarterly, and annual surveys, and also in the census of wholesale trade. The Bureau also publishes data on imports and exports in terms of SIC-based categories as well as the traditional Schedule B and TSUSA systems.<sup>10</sup>

## 5. GEOGRAPHIC CLASSIFICATION

**Census Divisions and Regions.**—In order to present census data at a level intermediate between the U.S. total and those for the

<sup>10</sup>Schedule B is the U.S. export classification while TSUSA is applied to imports.

Note: The Flint, Mich., SMSA falls within the top 50 SMSA's, but is excluded from this table to avoid disclosing figures for individual companies.

individual 50 States and the District of Columbia, the Census Bureau has used regional groupings for over a century. Since the 1909 Census of Manufactures, the present nine geographic divisions have been used. Beginning with the 1939 census, the nine divisions were also classified into four geographic regions: Northeast, South, North Central, and West.

Not only are these groupings convenient for the summary presentation of census data below the U.S. level, but they are also essential to presenting a maximum of geographic information where the individual State data cannot be shown without disclosing figures for individual companies. (See section 22, "Confidentiality".) The relative importance of manufacturing among the regions, divisions, and States is shown in table F.

**Standard Metropolitan Statistical Areas.**—In addition to the data for the legally constituted geographic units (States, counties, and cities), all manufacturing totals are shown for approximately 230 standard metropolitan statistical areas (SMSA).<sup>11</sup> In the 1967 tables, detail for 2-, 3-, and 4-digit industries is shown for any

SMSA when it would not disclose data for individual companies and the industry had at least 250 manufacturing employees. Prior to 1967, detail had not been shown for SMSA's with under 40,000 total manufacturing employment and only industry group figures were shown for SMSA's with 40,000 to 190,000 employees.

Standard metropolitan statistical areas are integrated economic and social units with a large volume of daily travel and communication between the central city (having 50,000 or more population) and outlying parts of the area. Each area (except in New England) consists of one or more whole counties. An area may contain not only highly industrialized counties but also adjoining counties which, though primarily residential in character, contribute significantly to the industrial counties' labor force and are socially and economically integrated with the central city. These areas were defined by the Federal Committee on Standard Metropolitan Statistical Areas for general-purpose use in presenting economic and social data. In the New England States, similar integration criteria have been applied in defining standard metropolitan statistical areas, but on a city and town basis, because towns are regarded as the significant unit in this region of the country.

<sup>11</sup>See appendix F for a description of each SMSA.

The requirement that each SMSA consist of county units (except in New England) sometimes results in the inclusion in an area of a considerable amount of territory which would not ordinarily be considered "metropolitan," much less "industrial." It is recognized that metropolitan areas could be more accurately defined in terms of smaller area segments such as minor civil divisions, but the usefulness of areas so defined would be limited by the fact that many types of economic and social data are available only on a county basis.

Each SMSA is designated by the name of the principal city of the area. In addition to the name of the principal city, the area title may include one or two additional city names.

**Industrial Counties.**—In addition to industry statistics for standard metropolitan statistical areas, table 7 of each State report,

presents data by county for each industry group (2- and 3-digit) that had at least 450 manufacturing employees where it would not result in disclosure of figures reported by individual companies.

**Cities with 450 Manufacturing Employees or More.**—Summary totals and industry detail at the 2-digit level are shown for individual cities with 450 manufacturing employees or more, provided the data do not disclose information for individual companies.

Value added by manufacture in all SMSA's accounted for 76 percent of the U.S. total in 1967. The relative importance of the 50 largest SMSA's is shown in table G.

## II. METHODS

### 6. PLANNING AND PREPARATION

**General.**—The Census Bureau has an obligation to meet public needs for timely and reliable information while holding costs and the burden on respondents to a minimum. During the planning stages of the 1967 economic censuses, the advice of trade and professional associations, Federal and State government agencies, individual companies, labor unions, and research and educational organizations was solicited in an effort to reach both the users of data and the respondents who supply the basic figures. Simultaneously, studies of the problems encountered in the 1963 censuses were undertaken, and proposals to improve the methods of collection, processing, and tabulation were explored.

**A Major Processing Innovation.**—Beginning with the 1954 economic censuses, the basic mailing lists have been obtained from Internal Revenue Service (IRS) and Social Security Administration (SSA) records.<sup>12</sup> These records were also sampled to develop statistics for retail and service establishments with no employees. After the 1963 censuses, it was decided to investigate the feasibility of making greater use of the data in the IRS-SSA records. This effort led, in the 1967 censuses, to the exemption of over 2,000,000 firms from the filing requirement, including 120,000 small manufacturers. Instead, census-type statistics for this group were developed from IRS-SSA records. Well in advance of the data collection phase of the censuses, plans for using these records for small employers were developed in close cooperation with those agencies. Specific procedures for this use and for assuring confidential treatment of individual tax returns were set forth in Executive Order No. 10911, dated January 17, 1961, and Treasury Decision No. 6547 of the same date. The basic records used were business income tax returns (IRS forms 1040C, 1065, 1120, and 1120S) and payroll tax returns (IRS form 941). The information obtained from these reports was the name and address, payrolls, and gross business receipts. In addition, an SIC industrial activity code was assigned by use of the permanent SSA records which indicate the industry or kind of business of each employer. Other census statistics for these small firms were imputed, using industry average ratios to payrolls and sales.<sup>13</sup>

**Planning the Content of Questionnaires.**—As in previous censuses, the content of the 1967 questionnaires was developed in consultation with a large number of organizations and individuals, representing both the manufacturers who supply the basic data and those who use the resulting statistics. Those consulted included government agencies, individual firms, labor unions, the American Statistical Association, the American Economic Association, the American Marketing Association, the National Association of Manufacturers, and all national manufacturers' associations covering specific industries.

A special effort was made to obtain the advice of individual manufacturers and their trade associations as to the content of the sections of the report forms dealing with the output of specific products. Drafts of the proposed 1967 product sections were circulated among 800 trade associations and about 4,000 manufacturing companies, both large and small. These inquiries followed the pattern of the 1963 census inquiries, with the introduction of new product detail reflecting suggestions received by the Census Bureau after the 1963 canvass. Small items (those valued at \$5 million or less) were not retained in the list unless they were needed to simplify the classification of other products or were of strategic importance. The manufacturers and others consulted in this clearance procedure were requested to comment particularly as to whether the proposed detail was readily reportable from business records, and whether it represented the most appropriate set of items for the industry. A restriction was placed on proposals for additional detail; it was stipulated that the 1967 value of any new product category should exceed \$15 million.

The thousands of comments and suggestions received in this clearance procedure were analyzed by the census staff. Finally, a detailed account of the review procedure and the decisions reached was forwarded to the Office of Statistical Standards, Bureau of the Budget, along with the Census Bureau's recommendations for the content of the product sections.

The final review of the content was performed by the Office of Statistical Standards with the assistance of the Advisory Council on Federal Reports. The latter organization is a group of business executives representing a cross section of industries and various professions within companies such as controllers, economists, and market research directors.

<sup>12</sup>The 1947 Census of Manufactures list was also obtained from the SSA.

<sup>13</sup>As discussed elsewhere in this introduction, the amount of imputation introduced by this procedure was only about 1 percent of the overall totals.

## 7. REPORTING FORMS

A representative selection of the reporting forms used in the 1967 census is reproduced in appendix D. The uses of each of them are discussed below.

**General Forms.**—This group of forms was used in the economic censuses generally, either as companywide reports or as reports for establishments whose classification was not known precisely in advance of mailing.

**NC-X1A, Report of Company Organization.**—This companywide report and its companion form NC-X1B were used in the precensus of multiunit companies conducted in 1967. A more detailed account of their use is given in section 8, "The Mailing Lists."

**NC-X3, General Schedule.**—This questionnaire was designed to obtain information from small companies for which the industry code available in the SSA records was not precise enough to indicate which one of the standard census questionnaires should be mailed. The information provided on form NC-X3 was used to classify these companies by industry and tabulate their data in the appropriate census.<sup>14</sup>

**NC-X6, Central Administrative Offices or Auxiliary Establishments.**—Many multiunit companies maintain separate establishments to provide centralized administrative, management, or other supporting services for other establishments of the same company, but not for the general public or other companies. These establishments were asked to complete form NC-X6. The form contained questions on approximate employment for such functions as centralized administration, research and development, warehousing, and other auxiliary activities, and on the cost of research and development work performed by these nonmanufacturing establishments.

### Annual Survey of Manufactures Forms.

**MA-100.**—This form is the establishment report used in the ASM since 1949 (with modifications). As mentioned above, this form was used in 1967 as the first sheet of the census of manufactures report for the establishments included in the ASM sample. The establishment's 1966 data were imprinted on the report form before mailing, thus aiding the respondent in following the instructions for the census. Item 9, "Quantity and value of products shipped and other receipts," on form MA-100 corresponds to item 18 on the census form MC-36B and its companion forms, the difference being that item 18 called for more detailed information on product shipments.

**MA-101, Expenditures for Plant and Equipment for Manufacturing Establishments Under Construction.**—This form was designed to obtain data on capital expenditures by large manufacturing firms for new plants not yet in operation at the end of the year. It was mailed to all multiunit companies with 250 employees or more. It was also mailed to any other company which indicated on one of its establishment report forms, in a special check-box section, that it had a plant under construction but not yet in operation. Each such plant was coded geographically and to a 4-digit industry from the description given of its expected activity. The information obtained on form MA-101 was included in the capital expenditures figures in the 1967 census tabulations. (For further discussion, see section 18, "Capital Expenditures.")

**Other Related Forms.**—Form CB-51J-1, "Manufacturers Sales Branches and Sales Offices," which is reproduced in appendix D, is typical of the several forms used for these establishments in the census of business. The forms differed only in the kinds of products sold as listed in item 12. In item 5, line b provided verification of the classification of the establishment as a sales branch or sales office. If the line-b percentage indicated that more than half of the goods sold were not manufactured by the parent company, the establishment was reclassified into one of the merchant wholesaler categories.

**NC-K1, Company Summary Report.**—Each multiunit company with 250 employees or more received a form NC-K1, Company Summary Report, along with the appropriate questionnaires for its establishments. The NC-K1 requested consolidated company totals for key data items, such as receipts, new capital expenditures, inventories, and fixed assets. In addition, each company was asked to distribute the 1967 employment reported on its establishment questionnaires by its IRS-SSA employer identification numbers (EI numbers) and to compare these totals to the figures reported on its Treasury Form 941 tax returns. This comparison provided assurance that all domestic establishments of each large multiunit firm and its subsidiaries would be included in the censuses. Form NC-K1 served this operational purpose and also provided essential data for the enterprise statistics program described above in section 1.

**Census of Manufactures Forms.**—The questionnaire reproduced in the appendix, form MC-36B, is typical of the 180 forms used for operating manufacturing establishments. Each of these forms was designed to be used for a specific group of industries. For establishments included in the Annual Survey of Manufactures sample, form MA-100 was substituted for the front sheet of form MC-36B and its companion forms, since the content was virtually the same and it was desired to maintain continuity of reporting in the ASM. Whether or not form MA-100 was used, the inquiries on the 180 forms were identical except for the detailed questions on products shipped, materials used, and miscellaneous topics such as operations performed, equipment used, and delivery of products.

**MC-171, Department of Defense Establishments, and MC-D4, Penal Institutions.**—These forms were used to collect information on government-owned and government-operated manufacturing establishments. They were used for two types of establishments: (1) Manufacturing facilities owned and operated by the Department of Defense, and (2) prison industries (Federal, District of Columbia, and State). The data were prepared with the cooperation of the Department of Defense, the Department of Justice, and the District of Columbia and State prison systems. For Department of Defense installations, information was provided on employment, man-hours, payrolls, cost, and value of work done, by industry group and by State. For prison industries, however, only product data was requested. The data are presented in a special report included in Volume I and are not included in the totals for operating manufacturing establishments.

## 8. THE MAILING LISTS

**General.**—As discussed in section 6 above, the basic lists for 1967 were obtained from IRS-SSA records, supplemented importantly by the inclusion of the ASM list of 60,000 establishments. Since the IRS-SSA lists consist essentially of the names and addresses of companies rather than establishments,<sup>15</sup> however, it was

<sup>14</sup>The use of Form NC-X3 is also discussed in section 8, "The Mailing Lists."

<sup>15</sup>The SSA records for multiunit companies identify "reporting units," which in many instances correspond to census establishments. The differences are such, however, that it was found necessary to obtain up-to-date lists of establishments as described in this section. Also, the Census Bureau concept of a company differs from the IRS-SSA definition, since the Census company includes all establishments under common ownership or control; in the IRS-SSA records, subsidiary corporations are often treated as independent companies.

necessary to follow separate procedures for multiunit companies (those operating at more than one location).

**The Precanvass.**—Multiunit companies were required to file at least one establishment report<sup>16</sup> covering each location. In order to select the appropriate questionnaires, it was necessary to determine in advance the nature of operations at each location. Beginning early in 1967, therefore, a "Report of Company Organization" (form NC-X1A)<sup>17</sup> was obtained from firms known to be multiunits from previous census records. All multiunit firms included in the ASM reported on form NC-X1A. A shorter questionnaire, form NC-X1B,<sup>17</sup> was also sent to other firms which were regarded as possible multiunits, including all manufacturers with 500 employees or more who were not on the NC-X1A list.

Both of these forms consisted essentially of a report on company affiliation and a list of the domestic establishments operated by the company. Before the forms were mailed, the company's establishments as identified in census records were prelisted. In the instructions for form NC-X1A, the respondents were asked to make any necessary corrections to this list. In addition, they were asked to supply descriptions of any new establishments not already listed, including their approximate size.

Approximately 700 large multiunit companies were segregated for special handling in the prec canvass because problems involving overlap and duplication were anticipated. Many of these companies were active in retail and wholesale trade as well as in manufacturing. The instructions for the prec canvass were reviewed with these firms in personal discussions with officials of their accounting departments, in order to make certain that the procedure was understood and the establishments properly described on form NC-X1A.

**Initial Control File.**—This file, consisting of about 7 million names and addresses of companies, was assembled from IRS-SSA records and other sources including the 1963 economic census records. For manufacturing, the ASM records were incorporated in the file.

**Single-Unit Companies.**—The mailing lists for single-unit companies (those operating at only one location) were developed from the initial control file by removing out-of-scope companies (those whose activities were not to be surveyed in the economic censuses) and those identified as multiunits in the prec canvass. A special survey of out-of-scope companies with more than 50 employees in selected industries was conducted to doublecheck their eligibility, and some names were added to the mailing list as a result.

The final step was to set aside the records of the small companies for which census-type statistics were to be developed from administrative records. The remaining records constituted the mailing lists for single-unit companies.

**General Schedule.**—While the lists assembled in these ways were generally adequate in providing sufficient industry information to determine the proper form for mailing, a number of the records did not have precise industry information associated with them. Form NC-X3, "General Schedule," which is reproduced in appendix D, was mailed to all such companies. Since it was

assumed that these companies were quite small, only a few key figures were requested. On the basis of the information reported, these reports were coded and included in the basic tabulations. If form NC-X3 indicated that the company was actually large, it was later requested to file one or more of the appropriate standard questionnaires.

## 9. GEOGRAPHIC AREA CODING

Accurate and complete information on the physical location of each establishment is required in order to tabulate the census data by SMSA's, counties, and cities. As in previous censuses, the post office address and ZIP code of the establishment were not always accepted as defining the physical location, but respondents were required to describe the actual location in terms of street address, city, town or village, county, and State. For establishments located in rural territory, the name or number of the nearest highway was requested and the distance from the nearest town or other urban place.

In censuses prior to 1963, clerks assigned geographic code numbers to each establishment based on the description furnished by the respondent. This process was slow and required careful verification. Beginning with 1963, a computerized system was developed which assigned an area code number and a prefix symbol to the mailing address before the questionnaires were mailed. The prefix symbol indicated whether or not the mailing address was clearly acceptable as describing the physical location. If there was any question about its acceptability, the respondent's description was later carefully reviewed after the questionnaire was received. The assignment of tentative code numbers by the computer was based on extensive reference files containing nearly a million business names and addresses.

The geographic coding system used in the 1967 economic censuses was based on the 1963 system with some improvements and revisions. The major changes included expanding the address reference file, and use of the ZIP code as part of the procedure for matching addresses against the reference file.

## 10. DATA COLLECTION

**General.**—Although the greater use of administrative records in 1967 substantially reduced the number of companies canvassed directly, there remained nearly 2 million which were required to file, including about 175,000 manufacturers. The assembly of several hundred different questionnaires into mailing packages, correctly labeled and coded, combined with the correct instruction booklets, was an extensive operation.

**Instructions.**—Several general instruction booklets were prepared to assist respondents in completing questionnaires for the 1967 economic censuses. In addition, separate detailed instruction manuals were printed for establishments in a few kinds of business and in certain mineral industries with peculiar reporting problems, as well as for manufacturing establishments reporting on the detailed standard forms.

**Timing.**—The bulk of the 1967 questionnaires were mailed in mid-February 1968 with a due date of April 30, about 2 months later than the corresponding due date for the 1963 censuses. Adoption of the April 30 due date, which had been urged by accountants, was based on the assumption that reports would be filed more promptly if their preparation followed that of Federal income tax returns, which were due April 15, and that the "lost" 2 months would be gained back. This turned out not to be the case. The collection phase was not completed until early November 1968, about 2 months behind the 1963 record.

<sup>16</sup>If two or more distinct lines of activity were carried on at one location, separate reports were obtained under some circumstances. (For a complete discussion, see "Establishment Basis of Reporting" in section 4, above.)

<sup>17</sup>This form is reproduced in appendix D.

**Followup.**—Companies which did not return their questionnaires by the due date had to be reminded that their returns were overdue. A reminder card was used for the first followup, and form letters used in the five subsequent mailings. Two basic letter formats were used, one for multiunit companies that had returned questionnaires for some but not all establishments, and the other for companies that had not responded at all.

The last followup letter was mailed in October 1968. Estimates based on data from administrative records were included in the census tabulations for the relatively small number which had not responded by the closeout date in November 1968. Thus, all companies and establishments included in the original mailing list (except those determined to be inactive during 1967) were represented in the final statistical results, either by actual returns or by proxy returns generated from administrative records. A special effort was made to obtain actual returns from all large firms, so that the volume of business represented by proxy returns was relatively very small.

## 11. DATA PROCESSING

**General.**—The editing,<sup>18</sup> coding, and tabulation of data for the 5 million establishments represented in the 1967 economic censuses was a complicated task requiring extensive advance planning and careful coordination among the Census Bureau's organization subdivisions. Automatic data processing and other advanced techniques were used in all phases to a considerable extent.

**Facilities.**—In the mail collection phase, the questionnaires were returned by respondents to the Census office at Jeffersonville, Ind., where most noncomputer (that is, clerical) processing operations were performed. The Jeffersonville functions consisted mainly of preliminary screening of questionnaires, carrying on routine correspondence with respondents, punching cards, and transmitting the punched data to Washington on a high speed transmission system. The Washington staff handled computer operations, and all operations in connection with the use of IRS and SSA records.

**Preliminary Screening.**—After checking in against control lists and assigning geographic codes, the questionnaires were reviewed clerically to see that they conformed to certain minimum requirements before further processing. In the case of multiunit companies, the sum of employment and payrolls reported on its establishment questionnaires was compared with the control totals reported on form NC-K1, "Company Summary Report." Questionnaires received from ostensibly single-unit firms were reviewed to ascertain whether they had become multiunits through merger or acquisition. All questionnaires were reviewed to see that the entries were legible and punchable, and that entries appeared for a number of key items. For manufacturing establishment returns, the key items were payrolls and value of shipments. Questions arising in the screening operation were resolved by writing or telephoning the respondents. Complex problems involving multiunit companies were either handled by a special task force of experienced analysts in Jeffersonville or were referred to the Washington office.

**Computer Editing.**—All of the establishment records from the 1967 censuses of manufactures and mineral industries underwent computerized processes of screening and detailed testing of data. While most of these programs were newly devised in 1967, they

were largely based on similar programs in use during the 1963 censuses. As in 1963, average values and tolerance limits for key operating ratios (for example, cost of materials per dollar of shipments, payroll per employee, production-worker wages per man-hour, etc.) played a fundamental role in the editing process. However, more extensive testing and more sophisticated routines for adjusting data which failed the tests were incorporated into the 1967 programs. The need for computer editing may be judged by the fact that more than half of all 4-digit SIC industries had one or more data cells changed by more than 5 percent as a result of application of these programs.

In sequence, the computer programs used included a Housekeeping and Screening Edit, a Coverage Control and Matching Edit, a Magnitude Edit, a General Statistics Edit, an Inter-card Inter-column Edit, a Product and Materials Edit, a Duplicate Removal Program, and various programs of referral and of aggregate testing. These programs are described in outline form below. Also included within this sequence were programs of geographic coding and of industry coding, which are described elsewhere in this introduction.

The Housekeeping and Screening Edit was designed to inspect each record for the presence of basic information such as identification numbers, geographic codes, and source codes (that is, ASM, census of manufactures, or census of minerals). This program also included some simple data adjustments, such as the replacement of a missing total by a corresponding sum of detail.

The Coverage Control and Matching Edits were a system of programs which checked the consistency of clerically assigned coverage codes with reported information on the ownership status of the establishment. For ASM establishments, the program included matching with the 1966 ASM record file to identify corresponding prior-year records. In the 1967 Census of Manufactures, nearly 339,000 establishments were initially defined as being within the scope of manufacturing. Of this number, approximately 26,000 were identified as having no activity during 1967. Of the remainder, more than 11,000 were rejected from the combined output of the Housekeeping and Screening Edit and from the Coverage Control and Matching Edit. This latter number was clerically reviewed, corrected where necessary, and recycled back into the computer.

The Magnitude Edit was designed to test the size of two key items, payrolls and value of shipments. For ASM establishments, these items were compared with the corresponding entries for 1966, and were accepted if satisfactory. If not accepted, the ASM records were channeled through the standard edit, which compared payrolls to a historical employment-size code. Payroll figures passing the test were then used, in conjunction with cost of materials, in testing the value of shipments.

When failures in the magnitude tests were encountered, a fixed sequence of attempts to adjust the data were performed, which included dividing a reported figure by 1,000 (a common error was the reporting of values in dollars rather than in thousands of dollars as requested), or replacing a total by a sum of detail where these differed. If the corrective procedures of the Magnitude Edit were unsuccessful, the schedule was rejected for clerical inspection, correction where necessary, and recycling. This occurred for about 18,000 establishments.

The General Statistics Edit tested key operating ratios and adjusted the record or flagged it for later attention if it failed the test. Fifty-two such ratios were assigned for use in testing census of manufactures records, and 41 1966-67 ratios of change were used in testing the ASM reports. The tolerance limits and average values for these 93 ratios were based on the limits used for the corresponding tests in the 1963 census, with some correction and updating based on more recent ASM information.

<sup>18</sup>In data processing, the term "editing" means the review of information collected on questionnaires or from other sources, with the objective of locating and correcting erroneous entries.

In the presence of ratio failures, the computer program was designed to determine the component of the ratio which was most likely to have caused the failure. This was done by a process of inspecting other ratios containing each of the suspect components, and by computing an overall weighted-reliability index for each. The component with the lowest reliability index was judged to be incorrect. The computer then attempted to adjust the questionable figure by a process of "rounding" (multiplying or dividing by successive powers of 10), substitution of a total by a sum of detail, or by imputation based on one of the several ratios in which the suspect component was contained. After each such attempted adjustment, the new figure was accepted if it resulted in an improved reliability index.

In addition to testing and correction of reported information, the General Statistics Edit was the vehicle for the imputation of data for the 120,000 companies designated as administrative-record cases, as well as data for companies which failed to report in the mail canvass. Imputation for all reasons, failure to report as well as administrative records, accounted overall for about 3 percent of the total value of shipments. Records were not rejected and removed from the computer tapes in the General Statistics Edit, but were flagged and printed out for review by an analyst whenever the computer made a large adjustment, found a large year-to-year change, or could not make an acceptable adjustment after test failure. Excluding administrative records, about 40,000 such cases were printed out for review and possible correction.

The Inter-card Inter-column Edit was designed to test specific relationships among products, materials, and special inquiries. The record was flagged for inspection if the test failed; some 64,000 records were printed out for review from this edit.

The Product and Materials Edits were performed after the data on products and materials had been extracted from the basic establishment records, and assembled in product (or material) sequence. The edits were designed to inspect the reported quantities of production and of consumption after the corresponding values were tested and found acceptable. Unit values, in terms of dollar value per unit of quantity, were computed and ranked from highest to lowest. The most extreme values were removed, and the truncated data were used in the formulation of parameters (average deviation, central value, and upper and lower tolerance limits) which were printed out for review by analysts. This routine differs from those in other edits in that the parameters for editing were developed from the data at hand rather than from historic data or predetermined reasonableness limits.

The Duplicate Removal program was designed to identify and eliminate duplicate establishment records from the census.

The sources of duplication were many; imputed records which were followed by the late receipts of a report from the respondent was typical. The program resulted in the elimination of nearly 6,000 duplicate establishment records from the census file.

As in the 1963 census, this preliminary round of computer editing and professional correction was followed by a more detailed review of establishment records. Among the devices used at this stage were an "outlier" program which printed out establishment reports of dubious quality in terms of their internal consistency. The outlier program used some of the same ratios as the General Statistics Edit, but with parameters updated to reflect the characteristics of 1967, rather than earlier, data. Records with one or more suspicious ratios were printed out for review. In addition, aggregates of records at the industry and the geographic cell level were inspected with ratio tolerance limits adjusted to reflect the number of establishments contributing to the cell.

## 12. COVERAGE AND ACCURACY

Since the list of companies obtained from IRS and SSA records was considered to be complete, no field coverage check was conducted. The precensus and other special procedures for multiunit companies described in section 8, "The Mailing Lists," and section 10, "Data Collection," were designed to secure complete lists of establishments, thereby amplifying the IRS-SSA company list. Control totals in terms of employment and payrolls of multiunit companies were also used to verify the completeness of establishment coverage. This procedure is discussed in section 11, "Data Processing."

Comparison of statistics tabulated from the census of manufactures with the Census Bureau's Current Industrial Reports series, or with data originating with other agencies was possible in many instances, thus providing a further confirmation of completeness and accuracy. These figures range from employment and wage totals compiled by the Bureau of Labor Statistics to detailed commodity output figures published by the Internal Revenue Service, the Fish and Wildlife Service, and the Department of Agriculture. In the industry reports in Volume II, differences between the census of manufactures and other statistics are explained wherever possible. Census of manufactures comparability with broad measures such as national income, new capital expenditures, and production indexes are discussed elsewhere in this introduction. The Census Bureau's other procedures designed to improve the accuracy of the census data are discussed above in the sections on data collection and processing. Comments on the valuation of intracompany shipments by multiunit companies are included in section 15.

## III. COMMENTS ON STATISTICAL MEASURES AND TABLES

*(Explanations and definitions of the various measures of activity for which statistics are compiled in the census of manufactures are presented in appendix A. In the following sections, the limitations and other characteristics of some of these measures are discussed, the content of the statistical tables is described, and comparisons with other statistical series are presented.)*

### 13. EMPLOYMENT AND PAYROLLS IN ADMINISTRATIVE OFFICES AND AUXILIARY ESTABLISHMENTS

In the industry chapters of Volume II, the data on employment and payrolls refer to operating manufacturing establishments and

are so described. In the summary tables, the employment and payrolls of central administrative offices and auxiliary establishments are also included. However, whereas the operating establishments were coded to a 4-digit manufacturing industry, the administrative offices and auxiliaries were coded only to the 2-digit industry group of the establishments they served. In most of the tables with industry detail, the administrative offices and auxiliaries are shown as a separate industry group, but statistics for them by 2-digit industry appear in each volume in the General Summary tables. The relative importance of administrative offices and auxiliaries has increased substantially in recent years, because of a tendency to centralize functions formerly

performed in manufacturing plants. Such functions include accounting (particularly where computerized), warehousing, repair services, and miscellaneous others. As indicated in table H, this tendency was quite marked between 1954 and 1963, but there was less relative increase between 1963 and 1967.

TABLE H. Employment in Central Administrative Offices and Auxiliaries and in Operating Manufacturing Plants: 1967 and Earlier Census Years

Census year	Employees in operating manufacturing establishments		Employees in central administrative offices and auxiliaries		
	Thous- ands of em- ployees	Percent change from previous Census year	Thous- ands of em- ployees	Percent change from previous Census year	Percent of total employ- ment <sup>1</sup>
1967.....	18,492	+14.0	830	+14.3	4.3
1963.....	16,235	+5.3	726	+20.6	4.3
1958.....	15,423	-1.4	602	<sup>2</sup> +32.9	3.8
1954.....	15,645	(NA)	453	(NA)	2.8

Source: Census of Manufactures.

Standard notes: (NA) Not available.

<sup>1</sup>The total includes manufacturing establishments, central administrative offices, and auxiliaries.

<sup>2</sup>The apparent increase from 1954 to 1958 is believed to be somewhat overstated, because coverage of administrative offices and auxiliaries was more complete in the 1958 census.

## 14. MATERIALS

In addition to the total cost of materials which every establishment was requested to report, quantity and cost information was collected for approximately a thousand specific materials.<sup>19</sup> About 360 of these were "complete coverage" materials; i.e., every industry that consumed appreciable quantities of the material was canvassed so that the data would represent at least 90 percent of manufacturing consumption. For the remaining materials, information on consumption was obtained on a more limited basis, generally only in those industries in which the materials were important inputs. Detailed consumption information was collected in the standard materials inquiry, in the product inquiries (for items which were produced and consumed in the same plant), or in a few instances in special inquiries. The resulting statistics are presented mainly in tables 6A and 7A of the industry chapters, Volume II.

Because American industry uses an enormous variety of materials, the choice of materials for which "complete coverage" consumption data (90 percent or higher) were obtained had to be strictly limited. The selection of a particular material for such coverage was based on the following criteria:

- (1) The importance of the material as measured by the total value of U.S. consumption of the material;
- (2) The percentage of total consumption accounted for by manufacturing establishments;

<sup>19</sup>See 1967 Censuses of Manufactures and Mineral Industries, *List of Materials Consumption Items*, MC67-6, for a more detailed account of the collection of data on materials consumed.

- (3) The availability of consumption information from manufacturers' records; and
- (4) In certain instances, other factors such as the strategic importance of the material or the availability of historical data on the use of the material.

The materials included on a limited-coverage basis were chosen not only because they constituted important inputs for particular industries but frequently because they provided information necessary to classify plants by SIC industry. In using the detailed data on materials consumed which appear in table 7A in the industry chapters of Volume II, the following limitations should be noted:

- (1) Materials were reported for the establishment as a whole and no attempt was made to ascertain how much of the material was used in each of various products. Thus, the industry totals appearing in table 7A represent consumption in secondary products as well as primary products of the industry represented. The extent of secondary production is measured by the specialization and coverage ratios shown in table 5A of the industry chapters.
- (2) Attention should be paid to the codes ending in "000" and captioned "materials, parts, containers, and supplies, not specified by kind." The amounts appearing on these lines represent imputed totals for establishments whose statistics were developed by use of administrative records, and totals for other establishments which failed to report their consumption in specific terms. Thus, for most industries, the specific categories are understated. A judgment on the statistical significance of the understatement for each industry may be made on the basis of the relationship of the value shown for the "not specified by kind" (code 000) line compared with the total of materials, components, parts, containers, and supplies for the industry.
- (3) Establishments consuming less than a specified amount of material were not requested to report consumption of the material separately. For the majority of individual materials, the minimum amount was \$5,000. The use of this cutoff is not believed to have had a significant effect on the totals.

## 15. VALUE OF SHIPMENTS BY MULTIUNIT COMPANIES

**General.**—Except for a few industries as indicated in appendix A, the respondents were instructed to report net selling values, f.o.b. plant, after discounts and allowances and excluding freight charges and excise taxes. Multiunit companies were instructed to report for each establishment as if it were a separate economic unit and, in particular, to report interplant transfers at their full economic value, including not only the cost of production but also a reasonable proportion of company overhead and profits. Since there is no advertising or other selling cost involved, it would be expected that the value per unit of such transfers would be less than that for commercial sales. The plant receiving the transferred goods was instructed to include them in its cost of materials, valued as at the shipping point plus the cost of freight and other handling charges.

In the case of goods transferred to sales branches, or sold through separate sales offices, the implication of the "f.o.b. plant" instruction is that the value is at a somewhat lower level than the final invoice value, because the cost of selling (mainly the cost of operating the sales branch or office) is excluded.

In practice, there is reason to believe that these instructions were not followed by all companies. In a recordkeeping practices study of 54 multiunit companies conducted a few years ago, it was found that about half of them had reported interplant transfers of semifinished products at commercial or market prices, which tend to be somewhat higher than the "cost plus overhead and profit" requested in the census instructions. In the case of finished products transferred to separate selling organizations, half of the companies interviewed valued the products at their final or invoice price, which again would be somewhat higher than the "f.o.b. plant" transfer value requested. It appears from this study and other observations that the value of shipments of products reported by multiunit companies tends to be overstated. For products characterized by a substantial amount of interplant shipments, separate quantity and value figures were requested on the census forms. Data on these shipments, the unit value of which is less accurate than the unit value for shipments outside the company, are presented separately in table 6A in the industry chapters of Volume II.

**Individual Products.**—In the 1967 census program, information was collected on the output of approximately 10,500 individual product items.<sup>20</sup> The term "product" as used in the census of manufactures represents the finest level of detail for which output information was requested. Consequently, it is not necessarily synonymous with the term product as used in the marketing sense. In some cases it may be much more detailed and in other cases it is more aggregative. For example, pharmaceutical preparations were reported in terms of 160 products, while canned meats was a single product. Frequently, large aggregative values at the product level indicated that detailed production figures were available from other government sources or reliable private surveys.

Some 5,500 of the product items were listed separately on the 1967 census report forms. Data for the remaining 5,000 products were obtained in the monthly, quarterly, or annual commodity surveys comprising the Current Industrial Reports series of the Census Bureau. Totals for the year 1967 for these items as derived from the commodity surveys are shown in the "product shipped" table (table 6) in the industry chapters of Volume II together with the tieline total value collected in the census for reconciliation.

Typically, both quantity and value of shipments information was collected. However, if there was no meaningful physical quantity measure that could be reported by manufacturers, only value of shipments was collected. For products which are used to a large degree within the same establishment as materials or components in the fabrication of other products, total quantities produced and often the quantities consumed within the plant were collected. Typically, the information on production was also collected for products for which there are significant differences between total production and shipments in a given year because of wide fluctuations in finished goods inventories. Alternate measures of output of products, such as value of work done for products with long production cycles, were used as appropriate and feasible.

**Classes of Products.**—For the purpose of summarizing the product information, the separate products were aggregated into classes of products which were, in turn, grouped into all primary products of each industry. The code structure used is a 7-digit number for the individual product, a 5-digit code for the class of product, and a 4-digit code for the total primary products in an industry (see section 4 for application of coding structure to the assignment of SIC codes for establishments).

The 10,500 product items in the 1967 census (including products from the Current Industrial Reports program) were grouped into approximately 1,200 separate classes. Products were grouped into product classes to bring out significant differences in the broad types of products within a 4-digit industry. General similarity of the kind or purpose of the products or of the manufacturing processes, type of markets, or of materials used, were the basis for product combinations. The economic significance of the class was also taken into account; residual products of an industry were grouped when the products were not sufficiently significant in dollar value to warrant separate classes.

As a result of the increased number of respondents included in the product-class shipments totals, these categories lend themselves to many more cross tabulations than do the 7-digit products, without disclosing information about the operations of individual companies. In the industry chapters of Volume II, table 6B provides information on the value of shipments of product classes by State; and table 5B, by industry of the establishment producing them. The latter table is the best vehicle for showing the primary and secondary product mix of an industry, as well as the interrelationship between the 4-digit industry value of shipments and the 4-digit product group value of shipments. In table 8, the product class is used to provide finer industry-type general statistics by classifying establishments within an industry according to the degree to which they specialize in producing a specific class of products.

The class-of-product concept was incorporated by the Census Bureau into its own program with the 1947 Census of Manufactures after it developed the technique in the compilation of World War II production statistics. Product classes formed the basis of collecting product information in the annual survey of manufactures when that survey was initiated in 1949. The classes have been revised over the succeeding years to improve the balance and significance of product combinations within each industry and to keep abreast of the growth and decline of products.

**Effect of Use of Administrative Records on Product Data.**—As noted elsewhere in this introduction, 1967 census statistics for about 120,000 small manufacturers were developed by use of IRS and SSA records. Since the SSA records were coded only to the 4-digit SIC level, it was not considered feasible to estimate the product output of these small companies in terms of specific 5-digit product classes or 7-digit products. The total value of output was therefore coded to the 4-digit level and published separately in table 6A of the industry chapters of Volume II. In table I, page 18, these data have been summarized together with other undistributed 4-digit totals reported by the larger companies. It will be seen from table I that the contribution of the small companies to product totals was of little importance except in lumber, furniture, and printing and publishing (groups 24, 25, and 27). The large companies which for various reasons reported only in terms of group totals were of somewhat more importance, accounting overall for about 3 percent of the total value of product shipments.

Nominally, the shipments of "small companies" as shown in table I represent the output of all establishments with less than 10 employees. Actually, less than half of the value of shipments of establishments with less than 10 employees was obtained from administrative records. This was due to several factors, the most important of which were—

- (1) Many of the establishments with less than 10 employees were owned by multiunit companies and were covered in the mail canvass.

<sup>20</sup>See 1967 Census of Manufactures, MC67-1, *Numerical List of Manufactured Products*, and MC67-2, *Alphabetic List of Manufactured Products*.

TABLE I. Value of Products Not Specified by Kind: 1967

(Millions of dollars)

Product group code	Total value of product shipments	Products not specified by kind			
		Total	Large companies	Small companies <sup>1</sup>	Percent attributable to small companies
Total.....	539,470.1	23,387.2	17,884.6	5,430.6	1.0
20.....	78,650.9	4,088.2	3,326.7	761.5	1.0
21.....	4,589.7	46.4	44.2	2.2	.1

27.....	20,878.9	1,805.2	923.1	882.1	4.2
28.....	40,013.1	1,030.3	851.9	178.4	.5
29.....	20,992.8	159.2	130.0	29.2	.1
30.....	12,236.8	512.5	414.6	97.9	.8
31.....	4,849.8	238.8	180.8	58.0	1.2
32.....	13,596.9	585.6	404.3	181.3	1.3
33.....	55,926.8	670.6	607.9	62.7	.1
34.....	32,928.9	2,720.7	2,342.1	378.6	1.2
35.....	46,076.8	2,874.8	2,223.4	651.4	1.4
36.....	39,429.2	937.8	793.5	144.3	.4
37.....	64,976.3	854.7	718.3	136.4	.2
38.....	8,759.5	340.2	263.3	76.9	.9
39 plus 19.....	16,928.6	945.9	651.6	294.3	1.7

Note: Based on preliminary data. These values represent product shipments, irrespective of the industry in which the products were made, and therefore differ from the industry group totals shown in the General Summary tables.

<sup>1</sup>Estimates derived from administrative records. See text for further discussion.

(2) Questionnaires were mailed to about 6,000 of the companies identified as having less than 10 employees. Part of these were the small companies included in the ASM sample; the rest were included in the mail canvass to improve the estimates of general statistics, products, and materials.

(3) Some companies identified originally as having 10 employees or more turned out to have less than 10 in 1967.

(4) Some companies identified originally as having less than 10 employees were found to have been out of business in 1967.

Another factor tended to reduce the value of products not specified by kind attributed to small companies, thus affecting table I particularly. This was the fact that some 4-digit industries were represented by only one product category (an example is industry 3273, Ready-Mixed Concrete). Administrative-record estimates for products such as this were treated as specific information and not tabulated under the "not specified by kind" heading.

These factors taken together explain why the value of products "not specified by kind" attributed to small companies in table I is only 1 percent of the total, while the 157,000

establishments with less than 10 employees account for 2.3 percent of the total.

The data for many of the specific 7-digit products shown in table 6A are understated.

## 16. DUPLICATION IN COST OF MATERIALS AND VALUE OF PRODUCTS

The aggregate of the cost of materials and value of shipments figures for industry groups and for all manufacturing industries includes large amounts of duplication since the products of some industries are used as materials by others. With some important exceptions, such as SIC 3312, Blast Furnaces and Steel Mills, this duplication is not significant within individual 4-digit industries. However, it is significant at the 2-digit and 3-digit industry level because these group totals often include industries which represent successive stages in the production of a finished manufactured product. Examples are the addition of flour mills to bakeries in the total value of shipments of SIC Major Group 20 and the addition of pulpmills to papermills in Group 26. Economists have estimated that the value of manufactured products exclusive of such duplication—the value of finished manufactures—tends to approximate two-thirds of the total value of shipments reported in the census of manufactures.

Because the amounts of duplication contained in the cost of materials and value of products figures cannot be measured with any degree of precision, caution is urged with their use when they are provided at the 2- and 3-digit industry group level.

Even where no significant amount of duplication is involved, value of shipments figures are of limited use as measures of the relative economic importance of individual manufacturing industries or geographic areas because of the wide variation in ratio of materials, labor, and other processing costs to value of shipments, both among industries and within the same industry. To a large extent, value added by manufacture does not have these limitations and is therefore a better measure for comparison.

## 17. VALUE ADDED BY MANUFACTURE

**General.**—Value added by manufacture is derived by subtracting the total cost of materials (including materials, supplies, fuel, electric energy, cost of resales, and miscellaneous receipts) from the value of shipments (including resales) and other receipts and adjusting the resulting amount by the net change in finished

products and work-in-process inventories between the beginning and end of the year.<sup>21</sup>

Value added avoids the duplication in the value of shipments figure which results from the inclusion of the shipments of establishments producing materials and components along with the shipments of establishments producing finished products. It does not exclude purchased business services, as does the national income concept described below.<sup>22</sup> Nevertheless, it is considered to be the best value measure now available for comparing the relative economic importance of manufacturing among industries and geographic areas.

<sup>21</sup>For a few industries (for example, aircraft, ship building) where value of work done is substituted for value of shipments, no adjustment is made for change in inventories. In a few other industries where value of production is collected, the inventory adjustment is made only on the basis of change in work-in-process inventories.

<sup>22</sup>Collection of data on the cost of purchased business services at the plant level presents many problems. Advertising by multiunit companies, for example, is frequently charged at the company level and the cost either not allocated, to plants or if allocated, only as part of a broader company overhead category. National income data, on the other hand, are compiled in part from company rather than plant data, such as the *IRS Statistics of Income* in which advertising is presented as a separate cost item based on company reports.

TABLE J. Comparison of National Income Originating and Value Added by Major Industry Group: 1967  
(Billions of dollars)

SIC code	Industry group description	National income originating <sup>1</sup> (1)	Value added by manufacturing (2)	Col. (1) divided by col. (2)

<sup>1</sup>Source: Survey of Current Business, July 1970.

National income originating in the manufacturing sector, as developed in the national accounts maintained by the Office of Business Economics (OBE) is somewhat similar to value added in concept, but there are important differences. National income is the aggregate earnings of labor and capital which arise in the current production of goods and services in the manufacturing sector. Thus it measures the total factor costs incurred, and is a more "net" conception of value added than that which it has been found feasible to compile in the economic censuses, on an establishment basis. National income excludes, in addition to cost of materials, such other costs as depreciation charges, State and local taxes (other than corporate income taxes), allowance for bad debts, and purchases of services from nonmanufacturing enterprises, such as contract costs involved in maintenance and repair, services of development and research firms, services of engineering and management consultants, advertising, telephone and telegraph expense, insurance, royalties, patent fees, etc.

In part, the national income estimates are prepared from company rather than establishment data. This method results in the inclusion of some part of the net value added by nonmanufacturing establishments of companies classified as being primarily manufacturing, and conversely, in the exclusion of some part of the net value added by manufacturing establishments of companies classified as primarily nonmanufacturing. It is believed that for manufacturing as a whole the net effect increases national income. In the Petroleum and Coal Products major industry group, nonmanufacturing activities of manufacturing companies are so significant that this is the one group in which national income exceeds value added, as shown in table J.

**Historical Comparison.**—Whatever changes have taken place in the relative importance of the costs included in value added but excluded from national income have been gradual. As shown in table K, the ratio between the two figures has been fairly constant over the past decade, and the 1967 ratio is rather close to that for 1939.

TABLE K. National Income Originating in Manufacturing and Value Added by Manufacture: 1939 to 1967

(Billions of dollars)

Year	National income originating in manufacturing (1)	Value added by manufacture (2)	Col. (1) divided by col. (2)

Sources: National income, Survey of Current Business; value added, Census of Manufactures and Annual Survey of Manufactures.

<sup>1</sup>Unadjusted.

**Reconciliation with National Income Components.**—Figures are not available to permit a reconciliation of the estimates for value added in manufacturing and the national income originating in manufacturing for the current period. However, in 1957, the Census Bureau conducted a special survey, MC-D11, "Selected Costs and Assets of Manufacturing Establishments," which collected information on some of the costs included in value added for services purchased from other sectors or excluded from the national income estimates. These specific costs which accounted for about \$15 billion of the \$148 billion of value added in 1957 were maintenance and repairs, \$4.5 billion; insurance, \$.7 billion; property taxes, \$1.5 billion; rental payments, \$1.4 billion; and depreciation, \$7.3 billion. The residual value added, \$132 billion, was approximately \$16 billion in excess of national income of \$116 billion.

Table L presents an approximate reconciliation of national income and value added figures for manufacturing in 1957. The national income estimates for payrolls and other factor income in that year are based on the unrevised national income figures which are somewhat lower than the revised estimate appearing in table K. It should be noted that the labor costs included in national income and value added are reasonably close despite the fact that they are computed on a slightly different basis. If the proprietary and profit incomes of the company-based national income estimates are allocated to the establishments included in the census of manufactures, value added exceeds national income by \$35 billion of which \$15 billion is attributable to costs reported on survey MC-D11. Somewhat more than half of the \$35 billion excess represents the inclusion in value added by manufacture of purchased business services arising in other economic sectors; the remainder reflects conceptual differences arising from the inclusion, in value added, of indirect business taxes and depreciation which are excluded by definition from national income.

## 18. CAPITAL EXPENDITURES

Under this heading, manufacturers were instructed to report expenditures of the type chargeable to fixed assets accounts, for which depreciation reserves are normally maintained. Actual capital outlays during the year were requested, not the final value of equipment put in place or structures completed during the year.

The Census Bureau estimates of capital expenditures tend to be lower than those published in the joint Office of Business Economics-Securities and Exchange Commission survey. In addition to normal sampling variation, a major source of difference is to be found in the scope of the two series. Census data relate only to manufacturing establishments, whereas the OBE-SEC series covers all establishments of manufacturing companies—nonmanufacturing as well as manufacturing. This factor is particularly important in the petroleum industry where company expenditures for developing new wells and new distribution facilities are ordinarily much larger than their capital expenditures at refineries. On the other hand, manufacturing establishments of companies engaged primarily in nonmanufacturing activities are excluded from the OBE-SEC series but included in census figures. The OBE-SEC and census data for recent years are shown in tables M and N.

## 19. PLANT SPECIALIZATION

As discussed in section 4 above, the primary products of a plant are those which determine its industry classification; all other products are referred to as secondary products. The value of a plant's primary products in comparison to its total production is referred to as its degree of specialization. For each plant, two

TABLE L. 1957 Comparative Statistics on Value Added and National Income in Manufacturing  
(Billions of dollars)

Item	Value added	National income <sup>1</sup>
Total.....	147.8	112.5

<sup>2</sup>Preliminary.

<sup>3</sup>Excludes data for establishments under construction but not yet in operation.

measures of specialization were computed: (1) A 4-digit primary product-specialization ratio, which is the sum of the values of all the plant's primary products divided by the sum of all its primary and secondary products; and (2) a 5-digit primary product-class specialization ratio, which is the sum of the largest 5-digit product-class value divided by the sum of its primary and secondary products (the miscellaneous receipts of the establishment were not included in these calculations). For example, assume that an establishment reported the following:

Total value of shipments and other receipts	\$1,000
Miscellaneous receipts (resales, etc.)	15
Total value of products shipped	985
32721 Concrete pipe products	100
32722 Precast concrete products	785
32730 Ready-mixed concrete	100

This plant would be coded into SIC industry 3272, Concrete Products, with a primary product specialization ratio of 90 percent ( $\$885 \div 985$ ); it would be subclassified into the 5-digit class 32722, Precast Concrete, with a primary product class specialization ratio of 80 percent ( $\$785 \div 985$ ).

In the 1967 census, selected general statistics (number of establishments, employment, payrolls, value added, cost of materials, value of shipments, and capital expenditures) were tabulated to primary product-class levels by assigning the plant totals to the principal 5-digit codes. These data are presented in table 8 of the industry chapters, Volume II. For most product

classes, table 8 also provides general statistics for establishments specializing in the class to the extent of 75 percent or more.

Table 8 permits analysis of an industry in terms of the differences introduced by variation among establishments in the degree of specialization in the products of the industry or a subgroup (5-digit). For example, where the ratios among various statistics tend to be different for establishments specializing to different degrees in the products of the industry or in different product classes, the ratios for the industry as a whole would be significantly affected by changes in its product mix.

## 20. OPERATING RATIOS

Since all of the data collected in the census on establishment reports are interrelated, comparisons of the various measures of activity are of considerable interest. Beginning with the 1963 census, several ratios have been routinely computed and presented in the industry chapters of Volume II. For 1967 and earlier years, the following nine ratios were published for each 4-digit industry:

- Payroll per employee
- Production workers as percent of total employment
- Annual man-hours of production workers
- Average hourly earnings of production workers
- Cost of materials per dollar of shipments
- Cost of materials and payrolls per dollar of shipments
- Value added per employee
- Payrolls as percent of value added
- Value added per man-hour of production worker

## 21. SUBJECT REPORTS SHOWN IN VOLUME I, SUMMARY AND SUBJECT STATISTICS

Volume I includes 3 tables representing summaries of rearrangements of data appearing in the industry and area volumes, and 2 special reports presenting statistics which are not published elsewhere. The contents of Volume I are as follows:

**Chapter 1. General Summary.**—This chapter, which appears in other volumes as well as Volume I, provides summary tabulations of data presented in greater detail in other census tables.

**Chapter 2. Size of Establishments.**—This chapter provides a summary of the general statistics by size of establishment which appear in table 4 of the industry chapters, Volume II. Also included are data on central administrative offices and auxiliary establishments, classified by size.

**Chapter 3. Type of Organization.**—This report presents data for manufacturing establishments classified as to the legal form of ownership (corporate, individual proprietor, or partnership) and as to whether the owner was a multiunit or single-unit company.

**Chapter 4. Manufacturers' Inventories.**—These tables summarize the inventory data published in table 3 of the industry chapters, Volume II. A description of the statistics is given in appendix A.

**Chapter 5. Expenditures for Plant and Equipment.**—These tables summarize the expenditures data published in table 3 of the industry chapters, Volume II. A description of the data is given in appendix A and in section 18, "Capital Expenditures."

**Chapter 6. Materials Consumed.**—This chapter consists of a compilation of detailed statistics on consumption of materials, fuels, and electricity. These figures also appear in Volume II, Industry Statistics, as tables 7A and 7B.

**Chapter 7. Water Use in Manufacturing.**—This report presents the results of a survey of the 1968 consumption of water in establishments consuming 20 million gallons or more annually. A more detailed description of the report and definitions of the terms employed, is given in the introduction to chapter 7.

**Chapter 8. Selected Metalworking Operations.**—This report presents the results of an inquiry concerning employment in metalworking plants such as foundry, forge shop, die casting department, heat treating, etc. The number of establishments in which these facilities are operated is presented, as well as the number of production workers engaged.

**Chapter 9. Concentration Ratios.**—This special report presents concentration ratios and other information on the share of industrial activity accounted for by the largest companies, both for the United States as a whole and for each of the 420 manufacturing industries. A more detailed description of the report, and explanations of the terms employed, is given in the introduction to chapter 9.

**Chapter 10. Manufacturing Activity in Government Establishments.**—This special report presents data on manufacturing activities in selected types of government establishments in the United States. The statistics are not included in other census of manufactures tables, which cover only privately operated establishments. A more detailed description of the report is given in the introduction to chapter 10.

## 22. CONFIDENTIALITY

The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, geographic region and division totals are given precedence over individual States; States are given precedence over standard metropolitan statistical areas; standard metropolitan statistical areas over counties; and counties over cities. In tables showing industry detail, major industry group (2-digit) totals take preference over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because (1) it was considered preferable to show regional data for an industry, even at the cost of withholding data for another (usually the least significant) State in a region, rather than to show all publishable data for the individual States and group the disclosure States throughout the United States in an "all other" category as was done in the 1939 and earlier censuses; and (2) by giving preference to industry-group statistics over individual industries within each State, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

## 23. ABBREVIATIONS

The following abbreviations and symbols occur frequently in text, tables, and footnotes:

—	Zero
X	Not applicable
NA	Not available
n.e.c.	Not elsewhere classified
n.s.k.	Not specified by kind
lin.	Linear
equiv.	Equivalent
hp	Horsepower
kw.-hrs.	Kilowatt-hours
D	Withheld to avoid disclosing figures for individual companies
SIC	Standard Industrial Classification
IRS	Internal Revenue Service
SSA	Social Security Administration
ASM	Annual Survey of Manufactures
CIR	Current Industrial Reports
OBE	Office of Business Economics
SEC	Securities and Exchange Commission

Other abbreviations, such as lb., gal., yd., doz., and bbl., are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 pounds; where the figures are expressed in tons of 2,240 pounds, the unit of measure is specified as "long tons" or "gross tons."

Note: See appendix A for an explanation of terms used.

Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (X) Not applicable.

<sup>1</sup>The figures for 1939 to 1967 include data for employees at manufacturing establishments who were engaged in distribution and in construction work. The extent to which data for such employees were included in the figures for earlier years is not known. In addition to the employment and payroll for operating manufacturing establishments, manufacturing concerns ordinarily reported separately for central administrative offices or auxiliary units (e.g., research laboratories, storage warehouses, power plants, garages, repair shops, etc.) which service the manufacturing establishment(s) of a company. These figures were collected by the Bureau of the Census for 1967, 1963, 1958, and 1954. The data for 1967, 1963, and 1958 are shown in table 2.

<sup>2</sup>The method of compiling these figures has varied, as follows: All employees: for 1955-1967, figures represent the average of the number of production workers for the payroll period ended nearest the 15th of March, May, August and November, plus all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November; for 1947, an average of 12 monthly figures for all employees; and for 1939 and prior years, the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). Production workers: for 1949-1963, figures are based on employment for the payroll period ended nearest the 15th of March, May, August, and November; and for 1947 and prior years, they represent the average of 12 monthly figures.

<sup>3</sup>For the period 1954 to 1967 value added by manufacture represents adjusted value added and for earlier years, unadjusted value added. Unadjusted value added is obtained by subtracting the cost of materials, supplies and containers, fuel, purchased electric energy, and contract work from the value of shipments for products manufactured plus receipts for services rendered. Adjusted value added also takes into account (a) value added by merchandising operations (that is, the difference between the sales value and cost of merchandise sold without further manufacture, processing, or assembly), plus (b) the net change in finished goods and work-in-process inventories between the beginning and end of the year. For 1849-1933, cost of contract work was not subtracted from value of shipments in calculating value added by manufacture.

<sup>4</sup>The figures for 1951 to 1967 include expenditures for plants under construction and not yet in operation. This information was not collected prior to 1951.

<sup>5</sup>Based on current Federal Reserve Board bulletins.

<sup>6</sup>These figures represent estimates derived from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, therefore, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The standard errors associated with these estimates are published in the annual survey of manufactures volumes for this period.

<sup>7</sup>The 1958 and subsequent years figures include establishments classified in industry 3273, Ready Mixed Concrete, and establishments classified in industry 3599, Miscellaneous Machinery, that were engaged exclusively or almost exclusively in machine shop repair work. The data for such establishments are excluded from the figures for the period 1939 to 1957, but are included for 1929 and earlier years. The 1954 to 1967 figures include data for establishments engaged in the processing and distribution of fluid milk, industry group 202, dairies. These establishments were not included in the figures for earlier census years. In addition, beginning with 1954, the figures include data for Logging Camps and Contractors, industry 2411, which were not included within the scope of the 1947 census. There were also a number of changes in the definition of manufacturing industries during earlier census years that affect the comparability of the historical series. Among the more important of these were the following: Figures for 1935 and later years exclude data for railroad repair shops and manufactured gas which were included in 1899 to 1933 figures; the minimum size of establishment included for 1947 to 1967 was 1 employee; for 1921 to 1939, manufacturing establishments reporting value of shipments of \$5,000 or more were within scope whereas for 1919 and earlier years the cutoff was \$500. (These changes in procedure have not appreciably affected the comparability of the historical data except for the figures on number of establishments.)

<sup>8</sup>The figures for 1939, but not for earlier years, have been revised on the basis of retabulation of the returns to exclude data for establishments classified as manufacturing in 1939 and prior years but classified as nonmanufacturing beginning with 1947. Value added by manufacture for 1939, prior to revision and on a basis comparable with 1937 and previous years, was \$24.7 billion.

<sup>9</sup>Not revised to exclude data for establishments classified as manufacturing in 1939 and prior years but classified as nonmanufacturing beginning with 1947.

<sup>10</sup>The 1939 figures for "all employees" were revised on the basis of estimates rather than by retabulation of the 1939 reports. The estimates were made in the following manner: for number of employees, by multiplying the retabulated figure for number of production workers by the ratio of all employees to production workers computed from the unrevised 1939 statistics; for salaries and wages, by multiplying the retabulated wage figure by the ratio for salaries and wages also derived from the unrevised 1939 statistics.

<sup>11</sup>Not including data for salaried officers of corporations and their salaries and, therefore, not strictly comparable with figures for other years.

<sup>12</sup>These figures for 1899 and earlier years represent hand and neighborhood manufacturing operations.

TABLE 2. Manufacturing Employment: 1967, 1963, and 1958

Code	Major industry group	Year	All establishments		Operating manufacturing establishments		Administrative offices and auxiliaries	
			Employees (1,000)	Payroll (million dollars)	Employees (1,000)	Payroll (million dollars)	Employees (1,000)	Payroll (million dollars)
	All industries, total.....	1967	19,322.9	132,208.5	18,492.3	123,480.6	830.9	8,727.9

Note: See appendix A for explanation of terms used.

<sup>1</sup>The 1967, 1963, and most of the 1958 figures represent data for establishments located in the conterminous United States, Alaska, and Hawaii. However when the 1958 figures were previously published they did not include data for Alaska and Hawaii since these areas did not achieve statehood until 1959. The addition of the 1958 Alaska and Hawaii figures to the previously published figures for major industry groups 26 and 29 would have resulted in a disclosure. Therefore the 1958 Alaska and Hawaii data are excluded from these major groups but are included at the "all industries" level.

TABLE 3. General Statistics for Establishments by Industry Groups and Industries:  
1967 and 1963

Code	Industry group and industry	1967

Standard notes: - Represents zero. (X) Not applicable. (NA) Not available. (D) Withheld to avoid disclosing figures for individual companies.

<sup>1</sup>Includes expenditures for plants in operation and for plants under construction but not yet in operation.

<sup>2</sup>The total value of shipments for industry groups (2-and 3-digit) and a few individual industries (4-digit) includes extensive duplication arising from shipments between establishments in the same industry classification.

<sup>3</sup>Includes data only for privately-owned and/or operated establishments. Government-owned and operated establishments are excluded.

<sup>4</sup>In 1967 and 1963, in addition to the employment and payroll reported for operating manufacturing establishments, manufacturing concerns reported separately for central administrative offices or auxiliary units which serve the manufacturing establishments of a company (e.g., storage warehouses, power plants, research laboratories, garages, repair shops, etc.), rather than the general public. Separate reports were obtained if these units were at different general locations from the establishments served or if they serviced more than one manufacturing establishment. The figures shown for these units do not represent a separate industry but rather a balancing total for all manufacturing industries.

<sup>5</sup>Some of the small establishments in these industries may have been misclassified as to industry. This does not significantly affect the statistics other than the number of establishments. (See section of text on scope and coverage for further explanation).

<sup>6</sup>Establishments in this industry were requested to report value of production instead of value of shipments. Consequently, the formula for computing value added by manufacture was modified to exclude any change in finished products inventories between the beginning and end of the year.

<sup>7</sup>The data for 1967 for industry 2045 exclude establishments producing self-raising, phosphated, and bromated flour which is now classified in industry 2041. However for 1963, data were included.

<sup>8</sup>Data for 1967 for industry 2396 are not strictly comparable with prior years because of misclassification of several plants. These establishments accounted for approximately 5 to 10 percent of total employment and value of shipments in 1967.

<sup>9</sup>This is a minimum percentage. The exact percentage can not be shown without disclosing figures for individual companies.

<sup>10</sup>The 1963 data for industry 2651 are not directly comparable with other years due to an undetermined number of establishments reporting sanitary containers as folding boxes. This caused such establishments to be classified incorrectly to the Folding Box Industry.

<sup>11</sup>Value added data include government-owned, contractor-operated plants which were estimated based upon averages reported for commercial establishments in prior years. Cost of materials data excluded government-owned materials furnished to government-owned, contractor-operated plants and include fuel and electricity purchased by or for the establishments. Value of shipments data include a calculated value of shipments for government-owned, contractor-operated plants comprised of adjusted value added plus the cost of fuel and electric energy. Capital expenditures, new, include expenditures for plants under construction but not in operation. Capital expenditures of government-owned, contractor-operated plants are excluded from the totals for the industry.

<sup>12</sup>Included in the coverage ratio for industry 2992 are lubricating oils and greases which are also primary to industry 2911, Petroleum Refining. A 1967 coverage ratio computed on the basis of including both industries to which lubricating oils and greases are primary would total 99 percent; 67 percent by industry 2911, and 32 percent by industry 2992. The remaining 1 percent was shipped by establishments in other industries. Computed on the basis of excluding industry 2911, the 1967 coverage ratio is 96 percent for industry 2992.

TABLE 3. General Statistics for Establishments by Industry Groups and Industries:  
1967 and 1963—Continued

--	ADMINISTRATIVE AND AUXILIARY . . . . .	-	-	-	-	-	-	-	727.7	6 596.7	-	-	-

<sup>13</sup>Data for 1963 for industry 3461 have been revised by the inclusion of automotive stampings plants operated by automobile producing companies. The data for 1963 for industries 3711 and 3714 (previously identified as Census code 3717) have been revised by the exclusion of automotive stampings plants operated by automobile producing companies.

<sup>14</sup>The figures for 1967 for industry 3534 are not comparable with those for earlier years because some companies previously included construction receipts with value of shipments. Value added and value of shipments would have been \$50 million to \$75 million higher had they been on a basis comparable with earlier years.

<sup>15</sup>The value of shipments and cost of materials for this industry includes extensive duplication arising from shipments between establishments in the same industry classification. Accordingly, the specialization ratios and coverage ratios are not shown.

<sup>16</sup>In 1967 a number of establishments performing "machine shop jobwork" have been classified in this industry, which had previously been classified in other industries. This change in classification results mainly from the fact that a separate product code for such work (35993 11) was introduced in the 1967 Census of Manufactures. It appears that between \$400 million and \$600 million in value of shipments is accounted for by establishments which have been classified in other industries in prior years.

<sup>17</sup>The 1963 data for industry 3729 exclude establishments which were classified in industry 3723.

<sup>18</sup>Establishments in this industry reported value of work done rather than value of shipments. Consequently, the formula for computing value added by manufacture was not adjusted for inventory change between the beginning and the end of the year. It does include value added by resale.

<sup>19</sup>Industry group 399, "Miscellaneous manufactures," was previously identified as industry groups 398 and 399. The comparability of 1967 industry codes with those used in prior years is as follows:

1967 SIC	Prior year SIC	1967 SIC	Prior year SIC
3991	3981		3983
3993	3993		3984
3994	3988	3999	3987
			3992
3996	3982		3995
			3999

<sup>20</sup>Establishments in the industry were requested to report value of work done instead of value of shipments. Consequently, the formula for computing value added by manufacture was not adjusted for any inventory change between the beginning and end of the year.

<sup>21</sup>Government-owned, privately operated establishments did not enter into the calculation of "Primary product specialization ratio" or "Coverage ratio" as all dollar receipts for these establishments were included in "Miscellaneous receipts."

Note: See appendix A for explanation of terms used.

The totals at the State and U.S. level were derived from separate tabulations based on industry rather than State detail. The sum of the State detail does not add to the U.S. totals because of (1) independent rounding, and (2) independent correction to the industry tabulations and State tabulations.

Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than \$50 thousand or under 50 employees.

<sup>1</sup>The definitions of the standard metropolitan statistical areas are shown in appendix F.

Footnotes continued on next page.

TABLE 6. Manufacturing Employment and Payroll for Geographic Areas: 1967, 1963, and 1958—Continued

Footnotes--Continued

<sup>2</sup>For the SMSA's listed in the table below (whose definitions were revised in 1967) the 1963 and 1958 data do not include establishments located in the specified counties. County data for 1963 and 1958 for these units were not available.

Standard metropolitan statistical areas	County
Baltimore, Md.....	Hartford
Birmingham, Ala.....	Shelby and Walker
Corpus Christi, Tex.....	San Patricio
Dallas, Tex.....	Kaufman and Rockwall
Durham, N.C.....	Orange
Greensboro-Winston-Salem-High Point, N.C.....	Forsyth, Randolph, and Yadkin
Indianapolis, Ind.....	Boone
Lima, Ohio.....	Putnam and Van Wert
Little Rock-North Little Rock, Ark.....	Arkansas and Saline
Milwaukee, Wis.....	Washington
Washington, D.C.-Md.-Va.....	Loudon and Prince William in Virginia

For the SMSA's listed in the table below (whose definitions were added in 1967) 1958 or 1963 data are not available. The counties which comprise the SMSA are listed on the right.

Standard metropolitan statistical areas	County
Biloxi-Gulfport, Miss.....	Harrison
Bloomington-Normal, Ill.....	McLean
Fayetteville, N.C.....	Cumberland
Lafayette-West Lafayette, Ind.....	Tippecanoe
Mansfield, Ohio.....	Richland
McAllen-Pharr-Edinburg, Tex.....	Hidalgo
Oxnard-Ventura, Calif.....	Ventura
Salem, Oreg.....	Marion and Polk
Salinas-Monterey, Calif.....	Monterey
Sherman-Denison, Tex.....	Grayson
Tallahassee, Fla.....	Leon
Vineland-Millville-Bridgeton, N.J.....	Cumberland
Wilmington, N.C.....	Brunswick and New Hanover

TABLE 7. General and Comparative Statistics by Geographic Areas: 1967 and Earlier Years

Note: See appendix A for an explanation of terms. The totals at the U.S. and State level were derived from separate tabulations based on industry rather than State detail. The sum of the State detail does not add to the U.S. total because of (1) independent rounding, and (2) independent corrections to the industry and State tabulation.

Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. Revised.  
(X) Not applicable. (Z) Less than \$50 thousand or under 50 employees.  
<sup>1</sup>The 1958 and subsequent years' figures include establishments classified in industry 3273, Ready Mixed Concrete, and establishments classified in industry 3599, Miscellaneous Machinery, that were engaged exclusively or almost exclusively in machine shop repair work. The data for such establishments are excluded from the figures for the period 1939 to 1957, but are included for 1929 and earlier years. The 1954 to 1967 figures include data for establishments engaged in the processing and distribution of fluid milk, industry group 202, Dairies. These establishments were not included in the figures for earlier census years. In addition, beginning with 1954, the figures include data for Logging Camps and Contractors, industry 2411, which were not included within the scope of the 1947 census. There were also a number of changes in the definition of manufacturing industries during earlier census years that affect the comparability of the historical series. Among the more important of these were the following: Figures for 1935 and later years exclude data for railroad repair shops and manufactured gas which were included in 1899 to 1933 figures; the minimum size of establishment included for 1947 to 1963 was 1 employee; for 1921 to 1939, manufacturing establishments reporting value of shipments of \$5,000 or more were within scope whereas for 1919 and earlier years the cutoff was \$500. (These changes in procedure have not appreciably affected the comparability of the historical data except for the figures on number of establishments.)

<sup>2</sup>Employment and payroll totals for central administrative offices and auxiliaries are included in the statistics shown for the years 1954 to 1967. Prior to 1954, this information was not available. The "number of establishments with 20 or more employees" total for 1958 and all previous years and "total number of establishments" total for 1954 and previous years does not include data for central administrative offices and auxiliaries.

<sup>3</sup>For the years 1958 to 1967, includes expenditures for plants under construction but not in operation in addition to expenditures at operating manufacturing establishments. Prior to 1958, the data represents expenditures at operating manufacturing establishments only.

<sup>4</sup>This table includes data only for standard metropolitan statistical areas with 40,000 or more manufacturing employees in 1967 or 1963. The definitions of the standard metropolitan statistical areas are shown in appendix F.

<sup>5</sup>Comparable data for years prior to 1958 are not available due to a revision in the definition of the standard metropolitan statistical area. See the 1958 or 1954 Census of Manufactures Area Statistics, Volume III, for statistics for the area as defined at that time.

<sup>6</sup>Does not include data for Alaska and Hawaii.

<sup>7</sup>Data for 1954 employment and payroll exclude central administrative offices and auxiliary units. This information was not collected for Alaska and Hawaii in 1954.

<sup>8</sup>This SMSA changed definition in 1967. Historical data prior to that year is based on the old definition in this table. (See Volume III, 1963 Census of Manufactures for the prior definition.)

<sup>9</sup>The Greensboro-Winston-Salem-High Point SMSA changed definition in 1967. Historical data is revised to the current definition in this table.

## Chapter 2

# Size of Establishments

4 Central Administrative Offices and Auxiliaries, by Employment- Size Class and Major Industry Groups of Establishments Services: 1967 . . . . .	114

## SIZE OF ESTABLISHMENTS

Each establishment in the census is coded not only by industry and geographic region, but also by its size, based on the average number of employees for the year. In this report, information appears on the number of employees, payrolls, value added, and value of shipments and capital expenditures for ten employment size classes for each 4-digit industry, 2-digit major industry group, and for all manufacturing. Figures at the 4-digit industry level have been published earlier as table 4 of each separate industry report (MC67(2)-19A to MC67(2)-39D) and will appear in Volume II of the 1967 Census of Manufactures.

TABLE 1. Selected Statistics for Manufacturing Establishments, Classified by Establishment Employment Size: 1967, 1963, 1958, 1954, and 1947

Item and year	All establishments, total	Establishments with an average of--									
		1 to 4 employees	5 to 9 employees	10 to 19 employees	20 to 49 employees	50 to 99 employees	100 to 249 employees	250 to 499 employees	500 to 999 employees	1,000 to 2,499 employees	2,500 employees and over

Note: The 1963 data at the "all establishments, total" level and the individual size classes were derived from separate tabulations. Therefore the sum of the size class detail does not equal the "all establishments, total" because of (1) independent rounding or independent dropping of fractions of thousands (rather than rounding) in computer operations, and (2) independent review and correction of the separate tabulations. The difference between the sum of the size class detail and the "all establishments, total" are always less than one tenth of one percent.

(NA) Not available. Data for this item are included in the underscored figures at the left.

<sup>1</sup>For the years 1954, 1958, 1963 and 1967, value added by manufacture represents adjusted value added. Unadjusted value added is obtained by subtracting the cost of materials, supplies and containers, fuel, purchased electric energy, and contract work from the value of shipments for products manufactured plus receipts for services rendered. Adjusted value added also takes into account (a) value added by merchandising operations (that is, the difference between the sales value and cost of merchandise sold without further manufacture, processing, or assembly), plus (b) the net change in finished goods and work-in-process inventories between the beginning and end of the year.

<sup>2</sup>Includes expenditures for plants under construction and not yet in operation. Data for these establishments are included in the "1 to 4 employees" category. Capital expenditures figures, classified by establishment employment size, are not available for the year 1947.

TABLE 2. Percent of Total Manufacturing Activity, for Selected Statistics, by Establishment Employment Size: 1967, 1963, 1958, 1954, and 1947

Note: Detailed figures may not add to totals because of independent rounding or independent dropping of fractions of thousands (rather than rounding) in computer operations.

Standard notes: - Represents zero. (X) Not applicable. (NA) Not available. (D) Withheld to avoid disclosing figures for individual companies.

<sup>1</sup>Report forms were not mailed to companies that operated only one establishment and which Social Security payrolls indicated had fewer than 10 employees. Actual payrolls (and sales) for 1967 were obtained from administrative records of the Federal Government. The other statistics for these establishments were estimated from industry averages.

<sup>2</sup>Includes an unspecified amount for plants under construction but not in operation.

<sup>3</sup>Contains extensive duplication because the products of some establishments are used as materials by other establishments classified in the same industry.

<sup>4</sup>Figures are value of production.

<sup>5</sup>Production workers for this industry may be overstated by 5 to 7 percent. This resulted from an overestimation for administrative record class of establishments by as much as 20 percent due to an error in the imputation process. Other data were not affected.

<sup>6</sup>Definitions are as follows: Fully integrated works are establishments having coke ovens, blast furnaces, steel works, and rolling and finishing mills or a forging department; partially integrated works with blast furnaces are establishments having blast furnaces, steel works, and rolling and finishing mills or a forging department; nonintegrated works represent all other types of establishments in this industry including beehive coke ovens, byproduct coke ovens operated independently of blast furnaces and steel departments; merchant blast furnaces, and establishments with hot rolling and finishing operations. In a few cases, operations which are, in fact, fully integrated, are classified as partially integrated or nonintegrated because separate establishment reports were collected either because the operations are conducted in different cities or towns, or the company treats the operations separately for their own administrative reasons.

<sup>7</sup>Establishments in this industry reported value of work done rather than value of shipments. Consequently the formula for computing value added by manufactures was not adjusted for inventory change between the beginning and end of year.

<sup>8</sup>Production workers for this industry may be overstated by 3 to 5 percent. This resulted from an overestimation for administrative record class of establishments by as much as 20 percent due to an error in the imputation process. Other data were not affected.

<sup>9</sup>Production workers for this industry may be overstated by 1 to 2 percent. This resulted from an overestimation for administrative record class of establishments by as much as 20 percent due to an error in the imputation process. Other data were not affected.

## TYPE OF ORGANIZATION

Information concerning whether a plant is either independent or part of a multiestablishment company contributes importantly to our knowledge of the structure of manufactures in the United States. However, this classification is significantly affected by the way in which the census of manufactures is taken. In 1947, it was not taken in conjunction with the census of business or mineral industries and the multiunit classification depended on whether or not the company operated more than one manufacturing plant. In 1954 and since, the census of manufactures has been conducted in conjunction with the censuses of business and mineral industries, and so the multiunit classification now depends on whether or not the company operates at more than one location within the temporal spans of those censuses. Thus, in 1954, 1958, 1963, and 1967, a company with one manufacturing plant and a nonmanufacturing location or separate administrative office was classified as multiunit. While the importance of multiunit establishments, in terms of employment and value added, has increased since 1947 (see table 1), part of this increase is undoubtedly due to the change in collection procedures that took place between 1947 and 1954. However, during those years, this increase in employment and value added was accompanied by a decline in the percentage of establishments accounted for by multiunit companies. Part of this was due to the inclusion in the 1954 Census of Manufactures of industries characterized by a large number of small firms (e.g., milk distribution and logging) which account for a very small amount of the total manufacturing employment and value added. This shifting in the determination of single and multiunit establishments did not occur after the 1954 census and the 1958 and 1963 data are completely comparable.

In 1963, each establishment was asked to report the form of organization of the company which operated it. In 1967, a separate category of establishments was created to account for single-unit manufacturing firms with less than 10 employees which were excused from filing reports. Information for most single-unit establishments with less than 10 employees in 1967, is contained in the "administrative record" classification. Thus, the relative importance of the single-unit classification can be determined by the combination of the categories, "single-unit companies" and "administrative records." While these small plants account for approximately one-third of the total manufacturing establishments, they account for only 2 percent of the payrolls and value added. (See the Introduction for a further discussion of administrative records.)

TABLE 1. Selected Statistics for Operating Manufacturing Establishments, by Type of Operation and Legal Form of Organization: 1967, 1963, 1958, 1954, and 1947

Item <sup>1</sup>	Year	Establishments (number)	All employees		Production workers		Value added by manufacture (million dollars)	Capital expenditures, new <sup>2</sup> (million dollars)
			Total (1,000)	Payroll (million dollars)	Total (1,000)	Wages (million dollars)

NA Not available.

<sup>1</sup>The 1958 and 1963 figures include establishments classified in industry 3273, Ready Mixed Concrete, and establishments classified in industry 3599, Miscellaneous Machinery, that were engaged exclusively or almost exclusively in machine shop repair work. The data for such establishments are excluded from the 1954 and 1947 figures. The 1963, 1958 and 1954 figures include data for establishments engaged in the processing and distribution of fluid milk, industry group 202, Dairies. These establishments were not included in the 1947 figures. In addition, the 1963 and 1954 census figures include data for logging camps and contractors, industry 2411, which were not included within the scope of the 1947 Census. Data for Alaska and Hawaii, which are included for 1963, are not available on a type-of-operation and legal form of organization basis for 1958 and earlier years.

<sup>2</sup>The figures for 1954, 1958, 1963, and 1967 include expenditures for plants under construction and not yet in operation. This information was not collected for 1947.

<sup>3</sup>All data are based on reports for individual manufacturing establishments, and not on a company basis. Each establishment of multiestablishment companies is classified by its primary industrial activity. For this reason the statistics presented in this table cannot be compared directly with tabulations in which the whole corporation or company is the report-

ing unit and the entire company is classified in one industry, for example, "Statistics of Income, Corporation Income Tax Returns" compiled by the Bureau of Internal Revenue, U. S. Treasury Department. Since 1958, establishments were classified as part of a multiunit company when the company operated two or more establishments, of which at least one was a manufacturing establishment. In 1947, establishments were considered part of a multiunit only if the company operated 2 or more manufacturing establishments.

<sup>4</sup>Report forms were not mailed for 1967 to companies that operated only one establishment and which Social Security payrolls indicated had fewer than 10 employees. Actual payrolls (and sales) for 1967 were obtained from administrative records of the Federal Government. The other statistics were estimated from industry averages.

<sup>5</sup>For 1963 and earlier years, the difference between the sum of individual and partnership forms of organization and the total for noncorporate is represented by other noncorporate forms including cooperatives, establishments operated by estate administrators, trusteeships, receiverships, public and quasi-public organizations, and in addition, the misassignment of small establishments that were not corrected since they were not statistically significant. For 1967, this category is shown for each industry and for all manufacturing, total.

TABLE 2. Selected Statistics for Operating Manufacturing Establishments, by Type of Operation and Legal Form of Organization for Major Industry Groups and Industries: 1967

Code	Item	Establishments		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new <sup>2</sup>	Inventories end of--

Note: Industries 3994-3999, Morticians' Goods, Hard Surface Floor Coverings, and Manufactures, N.E.C., are not separately available, but included in total for Major Group 39, above. Major Group 19, Ordnance and Accessories, not shown separately but included in all industries total above.

Standard Notes: -Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (X) Not applicable.

<sup>1</sup>All data are based on reports for individual manufacturing establishments and not on a company basis. Each establishment of multiestablishment companies is classified by its primary industrial activity. For this reason the statistics presented in this table cannot be compared directly with tabulations in which the whole corporation is the reporting unit and the entire company is classified in one industry, for example, the "Statistics of Income, Corporation Income Tax Returns" compiled by the Bureau of Internal Revenue, U.S. Treasury Department. Establishments were classified as part of a multiunit company when the company operated two or more establishments, of which at least one was a manufacturing establishment.

<sup>2</sup>Includes expenditures for plants in operation and for plants under construction but not yet in operation.

<sup>3</sup>These figures include extensive duplication arising from shipments between establishments in the same industry classification. See Introduction for a more detailed discussion.

<sup>4</sup>Value of production rather than value of shipments. Consequently, the formula for computing adjusted value added by manufacture was modified to include only changes in work-in-process inventories between the beginning and end of the year.

<sup>5</sup>Value of work done rather than value of shipments. Therefore, value added has not been adjusted for any inventory change.

TABLE 1 Value of Manufacturers' Inventories for Industry Groups and Industries:	
End of 1967 and 1966 . . . . .	3
2 Value of Manufacturers' Inventories by Divisions and States:	
End of 1967 and 1966 . . . . .	12

## INVENTORIES

See Introduction for discussion on how census was conducted. The value of beginning-of-year and end-of-year inventories, respectively, held by each manufacturing establishment was obtained in the 1967 census. Separate inventory figures were requested for (1) finished products, (2) work in process, and (3) materials, supplies, fuel and other inventories.

Respondents were asked to report their inventories at approximate current costs if feasible; otherwise, "at book values." Since different methods of inventory valuation are used (LIFO, FIFO, etc.), the definition of the value of inventories aggregate for all establishments in an industry is not precise. The figures on change in inventory between the beginning and the end of the year are of considerably greater significance.

In using inventory data by stage of fabrication for all industries and at the 2-digit industry level, the following should be noted: An item treated as a finished product by an establishment in one industry may be reported as a raw material by another establishment in a different industry. (For example, the finished product inventories of a steel mill would be reported as raw materials by a stamping plant.) Such differences are present in the inventory figures by stage of fabrication shown for individual industries, industry groups, and all manufacturing which are merely aggregates of figures reported by establishments in specified industries. Further, the total finished-goods inventory for "all manufacturing" includes items that are not finished manufactured products.

For a few industries in the food group, there are special problems in the handling of inventories by stage of fabrication. These are industries in which the products are usually stored under controlled conditions, and the products are aged. Included among such types of products are stemmed and dried tobacco, cheese, and whiskey. It is not clear whether such products should be treated as finished goods, work in process, or material and supplies inventories while in storage. In the cheese and whiskey industries substantial finished-goods inventories have been reported while in the tobacco industries, the bulk of the inventories have been classified as materials and supplies. These data have been summarized in the inventory tables in a consistent manner for the years included in this report.

Note: The totals at the geographic area and U.S. level were derived from separate tabulations based on industry rather than geographic area detail. The sum of the geographic area detail does not add to the U.S. totals because (1) independent rounding and (2) independent correction to the industry tabulations and geographic area tabulations.

<sup>1</sup>For 1967, manufacturing firms with less than 10 employees were excluded from filing reports. Estimates for their inventory data were constructed from industry averages. See introduction, "The Census Report Forms", page III.

## EXPENDITURES FOR PLANT AND EQUIPMENT

Expenditures--In the 1967 census, manufacturers were asked to report expenditures made during the year for permanent additions and major alterations to their plants, as well as for new machinery and equipment purchases, that were chargeable to fixed asset accounts of manufacturing establishments and were of a type for which depreciation accounts are ordinarily maintained. Expenditures for machinery and equipment were to include those made for replacement purposes, as well as for additions to plant capacity. Excluded from such expenditure totals are costs of maintenance and repairs charged as current operating expense; new facilities and equipment leased from nonmanufacturing concerns; new facilities owned by the Federal Government but operated under contract by private companies; and plant and equipment furnished to the manufacturer by communities and organizations.

In addition to total capital expenditures, respondents were requested to indicate the following subtotals: (a) New structures and additions to plant (including major alterations and capitalized repairs and improvements); (b) new machinery and new equipment (including capitalized repairs and improvements); and (c) expenditures for used plant and used equipment acquired from others (including the U.S. Government).

The figures include (a) the expenditures made at manufacturing plants that were in operation during any part of the year, plus (b) expenditures made at plants that were not as yet in production. The data on capital expenditures for plants not in production at the end of 1967 were collected on a separate report form (MA-101) requesting companies to report the value of new plant and new equipment put in place during the year. This form was mailed to (a) the 1,500 largest manufacturing companies; (b) all other companies which indicated on the census of manufactures establishment report form or the "Listing of Establishments" Form NC-X-1 that they had one or more manufacturing plants under construction but not yet in operation at the close of 1967.

The Census Bureau estimates of capital expenditures differ from those published in the joint Office of Business Economics-Securities and Exchange Commission survey. In addition to normal sampling variation, a major source of differences is to be found in the scope of the two series. Census data relate only to manufacturing establishments, whereas the OBE-SEC series covers all establishments of manufacturing companies--non-manufacturing as well as manufacturing. On the other hand, manufacturing establishments of companies engaged primarily in nonmanufacturing activities are excluded from the OBE-SEC series but included in Census figures. Both series, it should be noted, exclude expenditures for plant and equipment at establishments owned by the Federal Government but operated under lease or contract by private companies.

TABLE 1. Manufacturers' Expenditures for Plant and Equipment: 1967 and Earlier Years

(Millions of dollars, except employees)

Year <sup>1</sup>	Expenditures for new plant and equipment <sup>2</sup>			Expenditures for used plant and equipment	All employees <sup>3</sup> (1,000)	Value added by manufacture <sup>4</sup>	Indexes of change for data (1958 = 100) in columns--		
	Total	New structures and additions to plant	New machinery and equipment				(a)	(e)	(f)
	(a)	(b)	(c)	(d)	(e)	(f)	(a)	(e)	(f)

1949 <sup>2 5</sup> .....	5,066.9	1,567.2	3,499.7	(NA)	13,566.9	75,366.5	53	88	53
1947 <sup>2 5 6</sup> .....	5,998.1	2,122.1	3,876.0	663.2	14,294.0	74,290.5	63	93	52

Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available.

<sup>1</sup>The 1958 through 1967 figures include establishments classified in industry 3273, Ready Mixed Concrete, and industry 3599, Miscellaneous Machinery, that were engaged exclusively or almost exclusively in machine shop repair work. The data for such establishments are excluded from the figures for the period 1947 to 1957. The 1954 to 1967 figures include data for establishments engaged in the processing and distribution of fluid milk, industry group 202, Dairies. These establishments were not included in the figures for earlier years. The 1954 through 1967 figures include data for Logging Camps and Contractors, industry 2411, which were not included within the scope of the 1947 census and 1949 to 1953 annual survey years. In addition, the figures for 1957 and earlier years do not include data for Alaska and Hawaii.

<sup>2</sup>The figures for 1951 to 1967 include expenditures for plants under construction and not yet in operation. This information was not collected prior to 1951.

<sup>3</sup>Represents employment at operating manufacturing establishments. Figures for central administrative offices and auxiliary units are not included.

<sup>4</sup>For the period 1954 to 1967, value added by manufacture represents adjusted value added and for earlier years, unadjusted value added. Unadjusted value added is obtained by subtracting the cost of materials, supplies and containers, fuel, purchased electric energy, and contract work from the value of shipments for products manufactured plus receipts for services rendered. Adjusted value added also takes into account (a) value added by merchandising operations (that is, the difference between the sales value and cost of merchandise sold without further manufacture, processing, or assembly), plus (b) the net change in finished goods and work-in-process inventories between the beginning and end of the year.

<sup>5</sup>The expenditures figures for 1949 to 1953, 1955 to 1957, 1959 to 1962, and 1964 to 1966 are estimates derived from a sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The standard errors associated with these estimates do not exceed 1 percent.

<sup>6</sup>In 1947, very small establishments that accounted for approximately 1.6 percent of the total value added by manufacture did not report expenditure data and are not represented in the 1947 figures. See 1947 Census of Manufactures, Volume I, Chapter VI, for a measure of undercoverage by industry.

TABLE 2. Manufacturers' Expenditures for Plant and Equipment by Industry Groups and Industries: 1967 and 1963

Note: Detailed figures may not add to totals because of independent rounding or independent dropping of fractions of thousands (rather than rounding) in computer operations.

Standard notes: - Represents zero. (X) Not applicable. (NA) Not available. (D) Withheld to avoid disclosing figures for individual companies. (Z) Less than \$50 thousand.

<sup>1</sup>Includes data for plants under construction and not yet in operation.

<sup>2</sup>The data for 1967 for industry 2045 exclude establishments producing self-rising, phosphated, and bromated flour which is now classified in industry 2041. However for 1963, data were included.

<sup>3</sup>Data for 1967 for industry 2396 are not strictly comparable with prior years because of misclassification of several plants. These establishments accounted for approximately 5 to 10 percent of total employment and value of shipments in 1967.

<sup>4</sup>The 1963 data are not directly comparable with other years due to an undetermined number of establishments reporting sanitary containers as folding boxes. This caused establishments to be classified incorrectly to the Folding Box Industry.

<sup>5</sup>Prior to 1967 industries 3711 and 3714 were combined and identified as industry 3717. Data for 1963 for industries 3711 and 3714 have been revised by the exclusion of automotive stampings plants operated by automobile producing companies. As a result of this revision, these plants are now classified in the metal stampings industry (SIC 3461).

<sup>6</sup>The 1963 data for industry 3729 exclude establishments which were classified in industry 3723.

<sup>7</sup>Industry group 399, "Miscellaneous Manufactures," was previously identified as industry groups 398 and 399. The comparability of 1967 industry codes with those used in prior years is as follows:

1967 SIC	Prior year SIC	1967 SIC	Prior year SIC
3991	3981	3999	3983
3993	3993		3984
3994	3988		3987
			3992
3996	3982		3995
			3999

<sup>8</sup>Includes privately owned and/or operated establishments. Government owned and operated establishments are excluded.

TABLE 3. Manufacturers' Expenditures for Plant and Equipment by Divisions and States: 1967 and 1963

(In millions of dollars)

Division and State	1967				1963			
	Establishments in operation and under construction			Expenditures for used plant and equipment	Establishments in operation and under construction			Expenditures for used plant and equipment
	Total new expenditures	New structures and additions	New machinery and equipment		Total new expenditures	New structures and additions	New machinery and equipment

Note: The totals at the U.S. total level were derived from separate tabulations based on industry rather than State detail. The sum of the State detail does not add to the U.S. totals because of (1) independent rounding and (2) independent review and correction of the separate industry and State tabulations.

TABLE 4. Manufacturers' Expenditures for New Plant and Equipment, by Major Industry Groups, Divisions, and States: 1967

(In millions of dollars)									
Code	Major industry group	Establishments in operation and under construction			Code	Major industry group	Establishments in operation and under construction

Note: The United States and 2-digit levels were derived from separate tabulations based on industry rather than State detail. The sum of the States detail does not add to the United States totals because of (1) independent rounding, and (2) independent review and correction of the separate industry and State tabulations.

Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (Z) Less than \$50 thousand.

## MATERIALS CONSUMED

This chapter presents a compilation of the detailed statistics on materials and fuels. In using the data on materials consumed, the following limitations should be noted:

1. Materials were reported for the establishment as a whole and no attempt was made to ascertain how much of the material was used in each of various products. Thus, the industry totals represent consumption in secondary products as well as primary products of the industry represented. The extent of secondary production is measured by the specialization and coverage ratios shown in table 5A of the industry chapters. (See Volume II.)
2. Attention should be paid to code 976000 captioned "materials, parts, containers, and supplies not specified by kind." The amounts appearing on these lines represent imputed totals for establishments whose statistics were developed by use of administrative records and totals for other establishments which failed to report their consumption in specific terms. Thus, for most industries the specific categories are understated. A judgment on the statistical significance of the understatement for each industry may be made on the basis of the relationship of the value shown for the code 976000 line compared with the total of materials, components, parts, containers, and supplies for the industry.
3. Establishments consuming less than a specified amount of material were not requested to report consumption of the material separately. For the majority of individual materials, the minimum amount was \$5,000. The use of this cutoff is not believed to have had a significant effect on the totals.

Tables 7A and 7B at the end of this chapter are reprinted from the series of 80 industry reports.

TABLE 1A. Grains Consumed, by Selected Industries: 1967 and 1963

Code	Industry	1967		1963		1967		1963	
		Quantity (million bushels)	Delivered cost (million dollars)	Quantity (million bushels)	Delivered cost (million dollars)	Quantity (million bushels)	Delivered cost (million dollars)	Quantity (million bushels)	Delivered cost (million dollars)
		WHEAT (011371)				CORN (011301, 011321, 011322)			
	Total.....	574.1	1,406.4	628.9	1,393.4	748.4	1,026.2	632.0	860.2
2041	Flour and other grain mill products.....	531.2	1,328.4	583.1	1,312.8	92.8	130.5	85.6	111.4
2042	Prepared feeds for animals and fowls.....	30.3	51.5	30.2	53.1	369.0	500.8	311.2	420.0
2043	Cereal preparations.....	12.6	24.7	14.1	24.6	9.5	18.1	10.0	16.3
2045	Blended and prepared flour.....	(Z)	1.8	1.5	2.9	(Z)	(Z)	1.4	1.9
2046	Wet corn milling.....	-	-	-	-	224.1	289.1	171.5	233.1
2082	Malt liquors.....	-	-	-	-	19.9	39.5	20.2	35.3
2083	Malt.....	-	-	-	-	33.1	48.2	32.1	42.2
2085	Distilled liquor, except brandy.....	=	-	-	-	-	-	-	-
		OATS (011331)				BARLEY (011311)			
	Total.....	103.6	92.5	99.5	81.6	133.1	195.1	125.3	166.1
2041	Flour and other grain mill products.....	19.4	18.4	13.5	10.2	2.8	3.3	3.3	3.6
2042	Prepared feeds for animals and fowls.....	59.1	53.1	63.7	53.8	32.2	38.6	38.5	40.9
2043	Cereal preparations.....	25.1	21.0	22.3	17.6	1.6	2.2	.7	1.1
2045	Blended and prepared flour.....	-	-	-	-	-	-	-	-
2046	Wet corn milling.....	-	-	-	-	-	-	-	-
2082	Malt liquors.....	-	-	-	-	2.9	5.6	3.7	7.2
2083	Malt.....	-	-	-	-	93.6	145.4	79.1	113.3
2085	Distilled liquor, except brandy.....	-	-	-	-	-	-	-	-

Standard notes: - Represents zero. (X) Not applicable. (NA) Not available. (D) Withheld to avoid disclosing figures for individual companies.

Standard Notes: -Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (X) Not applicable.  
 n.e.c. Not elsewhere classified.

<sup>1</sup>Quantities include 37,194 long tons of reclaimed rubber produced and consumed in the same establishment in 1967, and 43,642 long tons in 1963. Value of this rubber is not reflected in the "Delivered cost" column.

<sup>2</sup>Quantities include less than 1 percent synthetic rubber produced and consumed in the same establishment. Value of this rubber is not reflected in the "Delivered cost" column.

<sup>3</sup>Quantities include the following percentages of reclaimed rubber which were produced and consumed in the same establishment: Industry 3011, between 12 and 15 percent; Industry 3021, between 25 and 50 percent; Industries 3031 and 3069, between 20 and 25 percent. Value of this rubber is not reflected in the "delivered cost" column.

## METALS, BEARINGS, AND MOTORS

This section presents data on the consumption of selected metal mill shapes and forms, castings, forgings, bearings, and motors.

### METAL MILL SHAPES, CASTINGS, AND FORGINGS

The materials used by the metal fabricating industries in producing machinery, automobiles, and thousands of other products consist primarily of metal mill shapes and forms, castings, and forgings. The tables which follow show the consumption, in terms of cost and quantity, of the most important of these metals--iron and steel, aluminum and aluminum-base alloys, and copper and copper-base alloys. No data are available for copper and copper-base alloy forgings.

The steel mill shapes are shown separately for three grades of steel: carbon, alloy, and stainless. Carbon steel is subdivided into six shapes, alloy steel into two shapes, while stainless steel is shown in total only.

The copper and copper-base alloy mill shapes are subdivided as follows: Bare wire for electrical conduction; insulated wire and cable; rod, bar, and mechanical wire; plate, sheet, and strip; and pipe and tube. There is a degree of duplication in the consumption of copper and copper-base mill shapes because of the inclusion in these tables of both bare wire for electrical conduction and insulated wire and cable. However, the consumption of bare wire by insulators of wire and cable is shown separately.

The aluminum and aluminum-base alloy mill shapes are subdivided as follows: Sheet, plate and foil; extruded shapes; and all other mill shapes.

For castings, consumption data are shown separately for iron, steel, aluminum and aluminum-base alloy, and copper and copper-base alloy. Forgings are shown separately for iron and steel and aluminum and aluminum-base alloy.

### INDUSTRY COVERAGE

General.--The tables on consumption by industry include data for approximately 100 metal-fabricating industries. These represent all significant users of metal in manufacturing, and are covered by Major Group 34, "Fabricated Metal Products," through Major Group 37, "Transportation Equipment," and several additional miscellaneous industries, including Major Group 25, "Furniture and Fixtures."

Although there were other metal consuming industries from which consumption data were either not collected or the quantities reported failed publication standards, the omission of these industries affects coverage only slightly.

To relieve very small metal consumers from reporting amounts negligible in terms of total consumption, a minimum usage requirement was established. Expenditures of less than \$5,000 for each shape or form were exempt from reporting both in terms of cost and quantity. It is estimated that the use of this minimum reporting requirement on the coverage of these materials would not, as a maximum, equal 2 percent of total manufacturing consumption.

When comparing consumption data with production figures, it should be noted that the consumption data cover manufacturing industries only. Consumption of these metal shapes in on-site construction, mining, farm uses, construction and maintenance of power lines, and in other nonmanufacturing areas, such as export, is not covered.

#### DEFINITION OF METAL MILL SHAPES AND FORMS

Although the inquiry on metals consumed on the 1967 census schedules did not include a definition of the metal shapes specified, the metal fabricating companies' familiarity with the terms and their meaning provided a high degree of uniformity in reporting. The term "bars and bar shapes" appearing in the tables showing steel consumption, includes hot-rolled and cold-finished bars, and tool-steel bars; "sheet and strip" includes hot- and cold-rolled, galvanized, and long ternes, but excludes tin plate, terne plate, and black plate; "wire and wire products" includes plain, galvanized, and other coated wire, as well as nails and spikes and the like; "all other carbon steel mill shapes and forms" includes ingots, billets, wire rods, concrete reinforcing bars, tin plate, terne plate, black plate, pipe, tubing, and rails, but not forgings or materials fabricated beyond the steel mill level.

The terms copper and copper-base alloy and aluminum rolled, drawn, and extruded shapes are similar to the steel mill products listed above; i.e., sheets, bars, tubing, wire, etc. They do not include wire bars, ingots, or other unrolled forms of copper or aluminum.

The data for bare copper wire are limited to wire for electrical conduction. Data for nonelectrical copper wire are included with rod and bar. The data for copper and copper-base alloy plate, sheet, and strip also include military cups and discs.

The castings (iron and steel, etc.) reported are only those in the rough and semifinished forms in which they are usually received from foundries. Castings, which had undergone extensive machining or other operations prior to their receipt at the consuming establishment, were considered as fabricated products rather than rough castings, and are not included in these data. However, such castings are reported as consumed by the establishments performing the machining operations.

Forgings.--To avoid duplication, data showing the consumption of iron and steel forgings are excluded from the totals for steel consumption since the quantities of forging stock, ingots, billets, and bars, used by the forging plants, are included in steel mill shapes and forms consumed. For this reason establishments in Industry 3391, "Iron and Steel Forgings" are classified as metal fabricators in table 4A rather than as producers of primary metals. In like manner, establishments in Industry 3392, "Nonferrous Forgings" are classified as metal fabricators in table 4C rather than as producers of aluminum and aluminum-base alloy mill shapes.

Bearings and Motors.--The consumption figures for bearings and motors account for most of the amounts used by establishments classified in manufacturing. The shipments figures for these products, however, also include amounts for exports, for use in nonmanufacturing activities, and for replacement and repair.

Comparable data for the year 1963 are available in Chapter 8, Volume I. Summary Statistics, 1963 Census of Manufactures.

Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (X) Not applicable. n.e.c. Not elsewhere classified. (Z) Less than one-half the unit of measure. <sup>a</sup>Between 10-30 percent of this figure was imputed. (S) Suppressed because data did not meet publication standards.

<sup>1</sup>Major Group (2-digit totals include (a) data for individual industries for which data are published as well as for those industries which could not be published without disclosing the operations of individual companies, and (b) an estimate of quantities for industries for which cost data were publishable but for which quantity data were suppressed because of significant nonreporting of quantity figures. The estimates for quantities are based on an average for a 2-digit industry group derived from those industry totals within the group for which valid totals of quantity and associated cost were reported.

<sup>2</sup>Includes data on the consumption of tin plate, black plate, and terne plate which amounted to 5,821.7 thousand short tons at a cost of \$1,270.5 million. Also includes concrete reinforcing bars which totaled 1,532.6 thousand short tons at a cost of \$185.8 million. Separate consumption statistics for these materials for selected industries are available in the industry by materials tables in another portion of this report.

## by Selected Industry Groups and Industries: 1967--Continued

						Carbon steel						Code

<sup>3</sup>The "Steel producing industries" include steel works and rolling mills, wire drawing establishments, independent pipe mills and cold rolling, drawing, and finishing establishments, but exclude forging plants (industry 3391, Iron and Steel Forgings) which are classified in this table as metal fabricators. To avoid duplication by counting both the forgings and bars and billets from which forgings are made, information for forgings is excluded. Also to eliminate duplication, the data shown for the "Steel producing industries" are limited to the mill shapes and forms consumed in the production of fabricated products or in maintenance and repair work and exclude the consumption of these products in the manufacture of other basic shapes and forms. The source of these data is Current Industrial Reports Series MA33B, "Steel Mill Products."

<sup>4</sup>The "Metal fabricating industries" include establishments whose primary activity is the manufacture of products fabricated beyond the metal mill level.

<sup>5</sup>Excludes industry 3392, Nonferrous Forgings. The total for all grades for this industry is 37.2 thousand short tons at a cost of \$19.0 million.

<sup>6</sup>These figures are understated because of apparent undercoverage of carbon steel pipe and tube. The approximate amounts of undercoverage are shown in the separate industry reports.

TABLE 4B. Copper and Copper-Base Alloy Mill Shapes and Forms Consumed, By Selected Industry Groups and Industries: 1967

Code	Industry group and industry <sup>1</sup>	Bare wire (for electrical conduction) (335725 and 335728)		Insulated wire and cable (335790)		Brass mill shapes

Standard notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (X) Not applicable. (S) Suppressed because the data did not meet publication standards.

<sup>1</sup>Major group (2-digit) totals include (a) data for individual industries for which data are published as well as for those industries which could not be published without disclosing the operations of individual companies, and (b) an estimate of quantities for industries for which cost data were publishable but for which quantity data were suppressed because of significant nonreporting of quantity figures. The estimates for quantities are based on averages derived from those industry totals within the group for which valid totals of quantity and associated cost were reported.

<sup>2</sup>The "Metal fabricating industries" include establishments whose primary activity is the manufacture of products fabricated beyond the metal mill or foundry level.

<sup>3</sup>In addition, 1,039.4 million pounds of bare wire for electrical conduction were produced and consumed by nonferrous wire drawing establishments in the manufacture of further fabricated products. Most of this consumption resulted in the production of insulated wire and cable.

<sup>4</sup>Excludes insulated wire and cable produced and consumed in insulating plants in the production of fabricated products such as appliance wire and cord and flexible cord sets.

<sup>5</sup>Excludes brass mill shapes produced and consumed in nonferrous metal mills in the manufacture of fabricated metal products for which figures are not available.

<sup>6</sup>Excludes figures for those industries for which consumption of pipe and tube was suppressed. Such suppressions are indicated by the symbol (S).

<sup>7</sup>Excludes figures for industry 3431, Metal Sanitary Ware. These figures, however, are included in the total for all metal fabricating industries.

<sup>8</sup>Excludes figures for industry 3741, Locomotives and Parts. These figures, however, are included in the total for all metal fabricating industries.

Standard Notes: - Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (NA) Not available. (X) Not applicable. (Z) Less than one-half of the unit of measure specified. (e) Between 10-30 percent of this figure was imputed. (n.e.c.) Not elsewhere classified.

<sup>1</sup>Major group (2-digit) totals include (a) data for individual industries for which data are publishable as well as for those industries which could not be published without disclosing the operations of individual companies, and (b) an estimate of quantities for industries for which cost data were publishable, but for which quantity data were suppressed because of significant nonreporting of quantity figures. The estimates for quantities are based on averages derived from those industry totals within the group for which valid totals of quantity and associated cost were reported.

<sup>2</sup>The "Metal fabricating industries" include establishments whose primary activity is the manufacture of products fabricated beyond the metal mill or foundry level.

<sup>3</sup>Excludes aluminum and aluminum-base alloy mill shapes produced and consumed in nonferrous metal mills in the production of fabricated products.

<sup>4</sup>Data for industry 3357 represents mill shapes and forms other than rods, wire for redrawing, and bare wire. For industries 3391 and 3392, represents all aluminum and aluminum-base alloy mill shapes.

<sup>5</sup>Excludes data for industries 3914, Silverware and Related Ware, and 3943, Children's Vehicles, except Bicycles.

<sup>6</sup>Excludes data for industry 1961, Small Arms Ammunition.

<sup>7</sup>Data for these items are included with "all other aluminum mill shapes and forms".

TABLE 4D. Selected Castings and Forgings Consumed, by Selected Industry Groups and Industries:  
1967

Code	Industry group and industry <sup>1</sup>	Casting - rough and semifinished								Forgings			
		Iron (gray and malleable) (332011)		Steel (332300)		Aluminum and aluminum-base alloy (336100)		Copper and copper-base alloy (336200)		Iron and steel (339100)		Aluminum and aluminum-base alloy (339200)	
		Quantity (1,000 short tons)	Delivered cost (million dollars)	Quantity (1,000 short tons)	Delivered cost (million dollars)	Quantity (million pounds)	Delivered cost (million dollars)	Quantity (million pounds)	Delivered cost (million dollars)	Quantity (1,000 short tons)	Delivered cost (million dollars)	Quantity (million pounds)	Delivered cost (million dollars)

1999	Ordnance and accessories, n.e.c.....												

Note: The data shown in this table represent purchases by metal fabricating plants from other establishments including interplant transfers between establishments operated by the same company. Data on the quantities of castings and forgings produced and consumed in the same establishment are excluded from this table but are available for selected industries in the industry by materials tables in another portion of this report.

Standard notes: - Represents zero. (X) Not applicable. (NA) Not available. (D) Withheld to avoid disclosing figures for individual companies. (Z) Less than one-half of the unit of measure specified.

<sup>1</sup>Major group (2-digit) totals include (a) data for individual industries for which data are published as well as for those industries which could not be published without disclosing the operations of individual companies and (b) an estimate of quantities for industries for which cost data were publishable but for which quantity data were suppressed because of significant nonreporting of quantity figures. The estimates for quantities were based on an average for a 2-digit industry group derived from those industry totals within the group for which valid totals of quantity and associated cost were reported.

<sup>2</sup>The "Metal fabricating industries" include establishments whose primary activity is the manufacture of products fabricated beyond the metal mill or foundry level.

TABLE 7A. Materials Consumed, by Kind: 1967 and 1963--Continued

(See Appendix, Explanation of Terms)

Code	Material	Unit of measure	1967		1963	
			Quantity	Delivered cost (million dollars)	Quantity	Delivered cost (million dollars)
	INDUSTRY 2015.--POULTRY DRESSING PLANTS					
	Materials, parts, and supplies, total.....		(X)	2,244.5	(X)	1,743.8
	Poultry killed:					
013011	Young chickens (including commercial broilers).....	Live weight				
		million lbs.....	8,644.1	1,285.1	6,174.8	946.6
013021	Hens (or fowl) and other chickens.....	...do.....	671.6	69.7	617.8	79.6
013431	Turkeys.....	...do.....	1,884.4	392.3	1,197.6	272.0
013435	Other poultry and small game (including ducks, geese, rabbits, etc.).....		(X)	11.7	(X)	10.8
	Other materials used:					
201501	Dressed poultry purchased as such.....	Dressed weight				
		million lbs.....	339.2	90.4	256.3	66.5
013451	Shell eggs.....	1,000 cases				
		(30 doz.).....	15,852.6	117.5	12,423.8	109.4
970099	All other materials, ingredients, containers, and supplies.....		(X)	181.0	(X)	150.9
976000	All other materials, parts, and supplies, n.s.k. <sup>2</sup> .....		(X)	96.8	(X)	107.9

Note: Detailed figures may not add to totals because of independent rounding or independent dropping of fractions of thousands (rather than rounding) in computer operations.

Standard notes: -Represents zero. (X) Not applicable. (NA) Not available. (D) Withheld to avoid disclosing figures for individual companies.

<sup>1</sup>An extensive review of these data have shown that a substantial number of establishments have included "baby beef" in this category.

<sup>2</sup>This item represents the total cost of materials for establishments that did not report detailed materials data. For 1967, this includes estimates for companies that were not mailed report forms.

<sup>3</sup>Included in All Other Materials, Code 970099.

Note: Detailed figures may not add to totals because of independent rounding or independent dropping of fractions of thousands (rather than rounding) in computer operations.

Standard notes: - Represents zero. (X) Not applicable. (NA) Not available. (D) Withheld to avoid disclosing figures for individual companies.

<sup>1</sup>This item represents the total cost of materials for establishments that did not report detailed materials data. For 1967, this includes estimates for companies that were not mailed report forms.

<sup>2</sup>Cost of delivered butter for Industry 2021, Creamery Butter, probably should have been reported by respondents as part of their cost of resales.

<sup>3</sup>Included with material code 970099.

TABLE 7A. Materials Consumed, by Kind: 1967 and 1963-Continued

(See Appendix, Explanation of Terms)

Code	Material	Unit of measure	1967		1963
